

16Mx64 bits PC100/PC133 SDRAM Unbuffered DIMM

based on 8Mx8 SDRAM with LVTTTL, 4 banks & 4K Refresh

GMM26416233ENTG

Description

The GMM26416233ENTG is a 16M x 64bits Synchronous Dynamic RAM MODULE which is assembled 16 pieces of 8M x 8bits Synchronous DRAMs in 54 pin TSOP II package and one 2048 bit EEPROM in 8pin TSSOP package mounted on a 168 pin printed circuit board with decoupling capacitors. The GMM26416233ENTG is optimized for application to the systems which are required high density and large capacity such as main memory of the computers and an image memory systems, and to the others which are requested compact size.

The GMM26416233ENTG provides common data inputs and outputs.

Features

- * PC133/PC100/PC66 Compatible
-7(143MHz)/-75(133MHz)/-8(125MHz)
-7K(PC100,2-2-2)/-7J(PC100,3-2-2)
- * 3.3V +/- 0.3V Power supply
- * Maximum Clock frequency
100/125/133/143 MHz
- * LVTTTL Interface
- * Burst read/write operation and burst read/
single write operation capability
- * Programmable burst length ;
1, 2, 4, 8, Full page
- * Programmable burst sequence
Sequential / Interleave
- * Full Page burst length capability
Sequential burst
Burst stop capability
- * Programmable CAS Latency ; 2, 3
CKE power down mode
- * Input / Output data masking
- * 4096 Refresh Cycles / 64ms
- * Auto refresh / Self refresh Capability
- * Serial Presence Detect with EEPROM

Pin Description

Pin Name	DESCRIPTION
CK0, 1, 2, 3 (input pins)	CK is the master clock input to this pin. The other input signals are referred at CK rising edge.
CKE0,1 (input pin)	This pin determines whether or not the next CK is valid. If CKE is High, the next CK rising edge is valid. If CKE is Low, the next CK rising edge is invalid. This pin is used for power-down and clock suspend modes.
$\overline{S}0,1,2,3$ (input pins)	When \overline{S} is Low, the command input cycle becomes valid. When \overline{S} is high, all inputs are ignored. However, internal operations (bank active, burst operations, etc.) are held.
\overline{RAS} , \overline{CAS} and \overline{WE} (input pins)	Although these pin names are the same as those of conventional DRAMs, they function in a different way. These pins define operation commands (read, write, etc.) depending on the combination of their voltage levels. For details, refer to the command operation section.
A0 ~ A11 (input pins)	Row address (AX0 to AX11) is determined by A0 to A11 level at the bank active command cycle CK rising edge. Column address is determined by A0 to A8 level at the read or write command cycle CK rising edge. And this column address becomes burst access start address. A10 defines the precharge mode. When A10 = High at the precharge command cycle, both banks are precharged. But when A10 = Low at the precharge command cycle, only the bank that is selected by BA0 is precharged.
BA0,1 (input pin)	BA0,1 are bank select signal. If BA0 is Low and BA1 is High, bank 0 is selected. If BA0 is High and BA1 is Low, bank 1 is selected. If BA0 is Low and BA1 is High, bank 2 is selected. If BA0 is High and BA1 is High, bank 3 is selected.
DQ0 ~ DQ63 (I/O pins)	Data is input and output from these pins. These pins are the same as those of a conventional DRAMs.
DQMB0 ~ DQMB7 (input pins)	DQMB controls input/output buffers. *Read operation: If DQMB is High, The output buffer becomes High-Z. If the DQMB is Low, the output buffer becomes Low-Z. *Write operation: If DQMB is High, the previous data is held (the new data is not written). If DQMB is Low, the data is written.
V _{cc} (power supply pins)	3.3 V is applied. (V _{cc} is for the internal circuit)
V _{ss} (power supply pins)	Ground is connected. (V _{ss} is for the internal circuit)
NC	No Connection pins.

Notes : 1. AC measurement assumes $t_r = 1\text{ns}$. Reference level for timing of input signals is 1.40V.

If t_r is longer than 1ns, transition time compensation should be considered.

2. Access time is measured at 1.40V. Load condition is $C_L = 50\text{pF}$ without termination.
3. $t_{LZ}(\text{min})$ defines the time at which the outputs achieves the low impedance state.
4. $t_{HZ}(\text{max})$ defines the time at which the outputs achieves the high impedance state.
5. t_{CES} define CKE setup time to CKE rising edge except Power down exit command.
