NOTES:

- (1) Bass and treble response see Figure 16. The center frequency and quality of the response behavior can be chosen by the external circuitry. A standard first order bass response can be realized by a standard feedback network.
- (2) The input is grounded through the 2.2µF capacitor.

APPLICATION NOTES

1. I²C BUS INTERFACE

Data transmission from microprocessor to the SC7315 and viceversa takes place through the 2 wires I²C BUS interface, consisting of the two lines SDA and SCL(pull-up resistors to positive supply voltage must be connected).

2. DATA VALIDITY

As shown in Figure 17, the data of the SDA line must be stable during the high period of the clock. The HIGH and LOW state of the data line can only change when the clock signal on the SCL line is LOW.

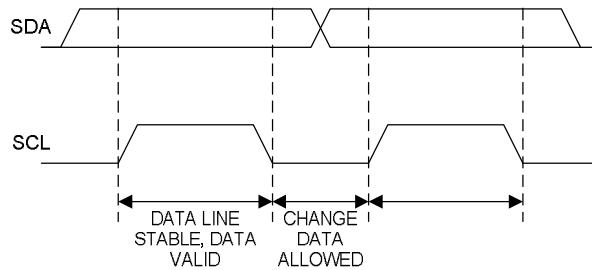

Fig. 17 Data Validity on the I²C BUS

3. START AND STOP CONDITIONS

As shown in Figure 18, a start condition is a HIGH to LOW transition of the SDA line while SCL is HIGH. The stop condition is a LOW to HIGH transition of the SDA line while SCL is HIGH.

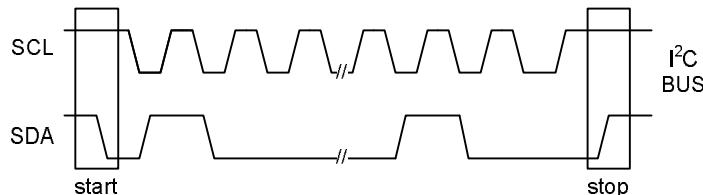

Fig. 18 Timing diagram of I²C BUS

4. BYTE FORMAT

Every byte transferred on the SDA line must obtain 8 bits. Each byte must be followed by an acknowledge bit. The MSB is transferred first.

5. ACKNOWLEDGE

The master(microprocessor) puts a resistive HIGH level on the SDA line during the acknowledge clock pulse(see Figure 19). The peripheral(audioprocessor) that acknowledges has to pull-down(LOW) the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during this clock pulse.

The audioprocessor which has been addressed has to generate an acknowledge after the reception of each byte , otherwise the SDA line remain at the HIGH level during the ninth clock pulse time. In this case the master transmitter can generate the STOP information in order to abort the transfer.

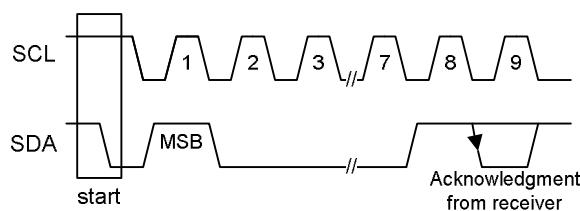

Fig. 19 Acknowledge on the I²C BUS

6. Transmission without acknowledge

Avoiding to detect the acknowledge of the audioprocessor, the microprocessor can use a simpler transmission: simply it waits one clock without checking the slave acknowledging, and sends the new data.

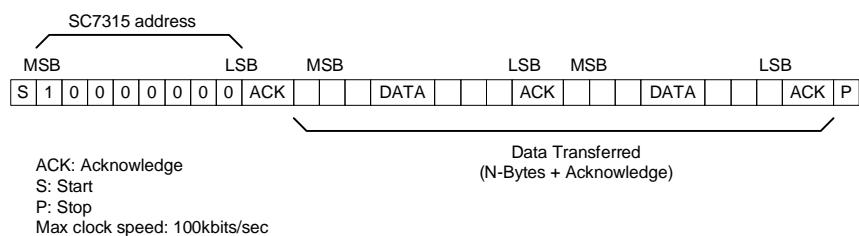

This approach of course is less protected from mis-working and decreases the noise immunity.

SOFTWARE SPECIFICATION

The interface protocol comprises:

- A start conditions
- A chip address byte, containing the SC7315 address(the 8th bit of the bytes must be 0). The SC7315 must always acknowledge at the end of each transmitted byte.
- A sequence of data(N-bytes + acknowledge)
- A stop condition (P)

TEST AND TYPICAL APPLICATION CIRCUIT

PACKAGE OUTLINE

HANDLING MOS DEVICES:

Electrostatic charges can exist in many things. All of our MOS devices are internally protected against electrostatic discharge but they can be damaged if the following precautions are not taken:

- Persons at a work bench should be earthed via a wrist strap.
- Equipment cases should be earthed.
- All tools used during assembly, including soldering tools and solder baths, must be earthed.
- MOS devices should be packed for dispatch in antistatic/conductive containers.
