**2 OVERVIEW**

The ABC200-10XXG is a high efficiency and high power density AC to DC power supply. It incorporates boundary conduction mode (BCM) PFC converter and soft-switching LLC converter, providing increased system reliability and high efficiency.

With around 1 m/s system air cooling, ABC200-1012G can delivery up to 180 W continuous output power, and 204W for ABC200-1024G and ABC200-1048G.

### 5.1 INPUT FUSE

A slow-blow 5A input fuses(5 × 20 mm)in series with Live line inside the power supply protects against severe defects. The fuse and a VDR form together with the input filter an effective protection against high input transients.

### 5.2 INRUSH CURRENT

The AC-DC power supply exhibits an X-capacitance of only about 1.0 μF, resulting in a low and short peak current, when the supply is connected to the mains. The internal bulk capacitor will be charged through a NTC resistor which will limit the inrush current (see Figure 2 and 3).

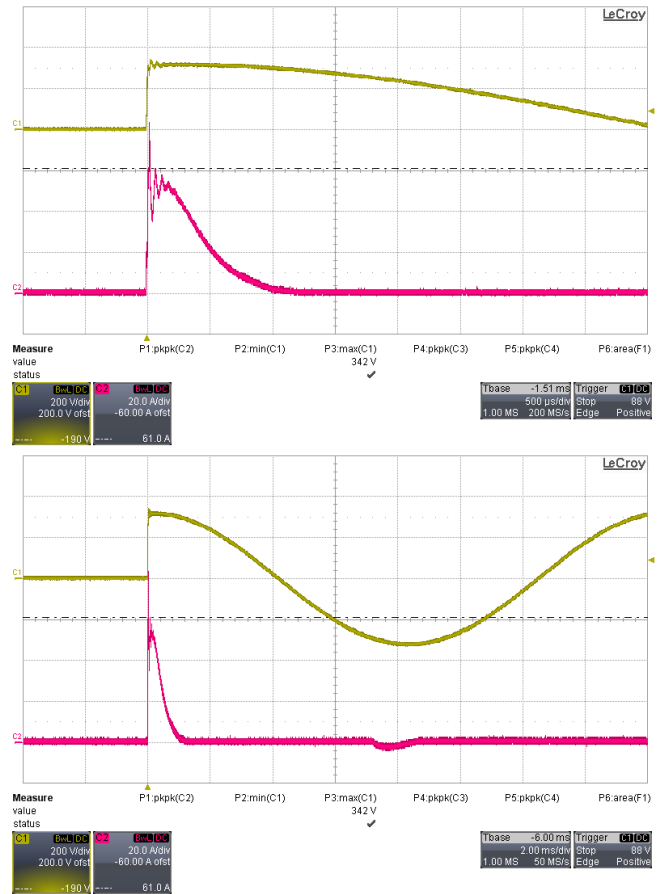

Figure 3: Inrush current,  $V_{in} = 230\text{Vac}$ ,  $90^\circ$   
CH1:  $V_{in}$  (200V/div), CH2:  $I_{in}$  (20A/div)

### 5.3 INPUT UNDER-VOLTAGE

If the sinusoidal input voltage stays below the input under voltage lockout threshold  $V_{i\text{on}}$ , the supply will be inhibited. Once the input voltage returns within the normal operating range, the supply will return to normal operation again.

### 5.4 POWER FACTOR CORRECTION

Power factor correction (PFC) is achieved by controlling the input current waveform synchronously with the input voltage. A specified PFC controller is implemented in the boundary conduction mode topology giving outstanding PFC results over a wide input voltage and load ranges. The input current will follow the shape of the input voltage.

### 5.5 EFFICIENCY

The high efficiency (see Figure 4) is achieved by using soft-switching LLC technology with boundary conduction mode PFC topology minimizing switching losses. Synchronous

rectifiers on the output reduce the losses in the high current output path for ABC200-1012G.

SCHOTTKY or ultra fast diode is used as rectifier in ABC200-1024G and ABC200-1048G because of high output voltage level.

### 7.1 OVERVOLTAGE PROTECTION

The AC-DC power supply provides a fixed threshold overvoltage (OV) protection implemented with a HW comparator. Once an OV condition has been triggered, the supply will shut down and latch the fault condition. The latch can be unlocked by disconnecting the supply from the AC mains only.

### 7.2 CURRENT LIMITATION

The main output current limitation will decrease with linear derating to 50% at 70  $^\circ\text{C}$  if the ambient (inlet) temperature increases beyond 50  $^\circ\text{C}$  (see Figure 13).

## 8 POWER GOOD SIGNAL

The Out-OK output gives a status indication of the converter and the output voltages. It can be used for control functions such as data protection, central system monitoring or as a part of a self-testing system. Connecting the Out-OK as shown in Figure 14,  $V_{OK} < 1.0$  V indicates the output voltage(s) of the converter are within the range.

Note: Using the potentiometer, the monitor level tracks the programmed output voltage. In an error condition, if the output voltage is out of range due to overload or an external over voltage,  $V_{OK}$  will approach  $V_p$ . The output is formed by an NPN transistor. The signal is isolated from the output.
