## 4-Mbit (256 K × 18) Flow-Through Sync

 SRAM
## Features

■ $256 \mathrm{~K} \times 18$ common I/O

- 3.3 V core power supply ( $\mathrm{V}_{\mathrm{DD}}$ )

■ 2.5 V or $3.3 \mathrm{~V} \mathrm{I/O} \mathrm{power} \mathrm{supply} \mathrm{( } \mathrm{~V}_{\mathrm{DDQ}}$ )
■ Fast clock-to-output times
■ 6.5 ns ( 133 MHz version)
■ Provide high performance 2-1-1-1 access rate
■ User selectable burst counter supporting Intel Pentium interleaved or linear burst sequences

- Separate processor and controller address strobes

■ Synchronous self timed write
■ Asynchronous output enable
■ Available in Pb-free 100-pin TQFP package
■ "ZZ" sleep mode option

## Functional Description

The CY7C1325G is a $256 \mathrm{~K} \times 18$ synchronous cache RAM designed to interface with high speed microprocessors with minimum glue logic. Maximum access delay from clock rise is 6.5 ns ( 133 MHz version). A 2 bit on-chip counter captures the first address in a burst and increments the address automatically for the rest of the burst access. All synchronous inputs are gated by registers controlled by a positive-edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip enable ( $\overline{\mathrm{CE}}_{1}$ ), depth-expansion chip enables $\left(\mathrm{CE}_{2}\right.$ and $\left.\mathrm{CE}_{3}\right)$, burst control inputs (ADSC, ADSP, and $\overline{A D V}$ ), write enables ( $\mathrm{BW}_{[\mathrm{A}: \mathrm{B}}$, and $\overline{\mathrm{BWE}}$ ), and global write $(\overline{\mathrm{GW}})$. Asynchronous inputs include the output enable $(\overline{\mathrm{OE}})$ and the $Z Z$ pin.
The CY7C1325G allows either interleaved or linear burst sequences, selected by the MODE input pin. A HIGH selects an interleaved burst sequence, while a LOW selects a linear burst sequence. Burst accesses can be initiated with the processor address strobe (ADSP) or the cache controller address strobe ( $\overline{\mathrm{ADSC}}$ ) inputs.
Addresses and chip enables are registered at rising edge of clock when either address strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).
The CY7C1325G operates from a +3.3 V core power supply while all outputs may operate with either $\mathrm{a}+2.5$ or +3.3 V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

Pin Configurations
Figure 1. 100 -pin TQFP $(14 \times 20 \times 1.4 \mathrm{~mm})$ pinout

## Pin Definitions

| Name | I/O | Description |
| :---: | :---: | :---: |
| $\mathrm{A}_{0}, \mathrm{~A}_{1}, \mathrm{~A}$ | Inputsynchronous | Address inputs used to select one of the 256 K address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\mathrm{CE}_{3}$ are sampled active. $\mathrm{A}_{[1: 0]}$ feed the 2 bit counter. |
| $\overline{\mathrm{BW}}_{\mathrm{A},} \overline{\mathrm{BW}}_{\mathrm{B}}$ | Inputsynchronous | Byte write select inputs, active LOW. Qualified with $\overline{\text { BWE }}$ to conduct byte writes to the SRAM. Sampled on the rising edge of CLK. |
| $\overline{\mathrm{GW}}$ | Inputsynchronous | Global write enable input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (all bytes are written, regardless of the values on $\overline{\mathrm{BW}}_{[\mathrm{A}: \mathrm{B}]}$ and $\overline{\mathrm{BWE}}$ ). |
| $\overline{\text { BWE }}$ | Inputsynchronous | Byte write enable input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write. |
| CLK | Input-clock | Clock input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation. |
| $\overline{\mathrm{CE}}_{1}$ | Inputsynchronous | Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\mathrm{CE}_{2}$ and $\overline{\mathrm{CE}}_{3}$ to select/deselect the device. $\overline{\mathrm{ADSP}}$ is ignored if $\overline{\mathrm{CE}}_{1}$ is HIGH. $\overline{\mathrm{CE}}_{1}$ is sampled only when a new external address is loaded. |
| $\mathrm{CE}_{2}$ | Inputsynchronous | Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}_{1}$ and $\mathrm{CE}_{3}$ to select/deselect the device. $\mathrm{CE}_{2}$ is sampled only when a new external address is loaded. |
| $\overline{\mathrm{CE}}_{3}$ | Inputsynchronous | Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}_{1}$ and $C E_{2}$ to select/deselect the device. $\overline{C E}_{3}$ is sampled only when a new external address is loaded. |
| $\overline{\mathrm{OE}}$ | Inputasynchronous | Output enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tristated, and act as input data pins. $\overline{O E}$ is masked during the first clock of a read cycle when emerging from a deselected state. |
| $\overline{\text { ADV }}$ | Inputsynchronous | Advance input signal, sampled on the rising edge of CLK. When asserted, it automatically increments the address in a burst cycle. |
| $\overline{\text { ADSP }}$ | Inputsynchronous | Address strobe from processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1: 0]}$ are also loaded into the burst counter. When $\overline{\text { ADSP }}$ and $\overline{\text { ADSC }}$ are both asserted, only $\overline{\text { ADSP }}$ is recognized. $\overline{\text { ASDP }}$ is ignored when $\overline{\mathrm{CE}}_{1}$ is deasserted HIGH. |
| $\overline{\text { ADSC }}$ | Inputsynchronous | Address strobe from controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. $A_{[1: 0]}$ are also loaded into the burst counter. When $\overline{\text { ADSP }}$ and $\overline{\text { ADSC }}$ are both asserted, only $\overline{\text { ADSP }}$ is recognized. |
| ZZ | Inputasynchronous | ZZ "sleep" input, active HIGH. When asserted HIGH places the device in a non-time-critical "sleep" condition with data integrity preserved.During normal operation, this pin has to be low or left floating. ZZ pin has an internal pull-down. |
| $\begin{aligned} & \mathrm{DQs} \\ & \mathrm{DQP}_{\mathrm{A}}, \\ & \mathrm{DQP}_{\mathrm{B}} \end{aligned}$ | I/Osynchronous | Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{\mathrm{OE}}$. When $\overline{\mathrm{OE}}$ is asserted LOW, the pins behave as outputs. When HIGH, DQs and $\mathrm{DQP}_{[\mathrm{A}: \mathrm{B}]}$ are placed in a tristate condition. |
| $\mathrm{V}_{\mathrm{DD}}$ | Power supply | Power supply inputs to the core of the device. |
| $\mathrm{V}_{\text {SS }}$ | Ground | Ground for the core of the device. |
| $\mathrm{V}_{\text {DDQ }}$ | I/O power supply | Power supply for the I/O circuitry. |
| MODE | Inputstatic | Selects burst order. When tied to GND selects linear burst sequence. When tied to $\mathrm{V}_{\mathrm{DD}}$ or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode pin has an internal pull-up. |
| NC | - | No connects. Not Internally connected to the die. |

## Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $\mathrm{t}_{\mathrm{CDV}}$ ) is 6.5 ns ( 133 MHz device).
The CY7C1325G supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user-selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the processor address strobe ( $\overline{\mathrm{ADSP}}$ ) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable (BWE) and byte write select ( $\left.\overline{B W}_{[A: B]}\right)$ inputs. A global write enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self timed write circuitry.
Three synchronous chip selects $\left(\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}\right)$ and an asynchronous output enable (OE) provide for easy bank selection and output tristate control. $\overline{\mathrm{ADSP}}$ is ignored if $\overline{\mathrm{CE}}_{1}$ is HIGH.

## Single Read Accesses

A single read access is initiated when the following conditions are satisfied at clock rise: (1) $\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}$, and $\mathrm{CE}_{3}$ are all asserted active, and (2) ADSP or ADSC is asserted LOW (if the access is initiated by ADSC, the write inputs must be deasserted during this first cycle). The address presented to the address inputs is latched into the address register and the burst counter/control logic and presented to the memory core. If the $\overline{\mathrm{OE}}$ input is asserted LOW, the requested data is available at the data outputs, a maximum to $\mathrm{t}_{\mathrm{CDV}}$ after clock rise. $\overline{\text { ADSP }}$ is ignored if $\mathrm{CE}_{1}$ is HIGH.

## Single Write Accesses Initiated by ADSP

This access is initiated when the following conditions are satisfied at clock rise: (1) $\mathrm{CE}_{1}, \mathrm{CE}_{2}, \mathrm{CE}_{3}$ are all asserted active, and (2) $\overline{\mathrm{ADSP}}$ is asserted LOW. The addresses presented are loaded into the address register and the burst inputs (GW, BWE, and $\left.\overline{B W}_{[A: B]}\right)$ are ignored during this first clock cycle. If the write inputs are asserted active (see Write Cycle Descriptions table for appropriate states that indicate a write) on the next clock rise, the
appropriate data is latched and written into the device. Byte writes are allowed. During byte writes, $\overline{B W}_{A}$ controls $\mathrm{DQ}_{\mathrm{A}}$ and $\mathrm{BW}_{\mathrm{B}}$ controls $\mathrm{DQ}_{\mathrm{B}}$. All I/Os are tristated during a byte write. Since this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tristated prior to the presentation of data to $\mathrm{DQ}_{\mathrm{s}}$. As a safety precaution, the data lines are tristated after a write cycle is detected, regardless of the state of OE.

## Single Write Accesses Initiated by ADSC

This write access is initiated when the following conditions are satisfied at clock rise: (1) $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\mathrm{CE}_{3}$ are all asserted active, (2) ADSC is asserted LOW, (3) ADSP is deasserted HIGH, and (4) the write input signals (GW, $\overline{\mathrm{BWE}}$, and $\left.\overline{\mathrm{BW}}_{[\mathrm{A}: \mathrm{B}]}\right)$ indicate a write access. ADSC is ignored if ADSP is active LOW.
The addresses presented are loaded into the address register and the burst counter/control logic and delivered to the memory core. The information presented to $D Q_{[A: D]}$ is written into the specified address location. Byte writes are allowed. During byte writes, $\mathrm{BW}_{\mathrm{A}}$ controls $\mathrm{DQ}_{\mathrm{A}}, \mathrm{BW}_{\mathrm{B}}$ controls $\mathrm{DQ}_{\mathrm{B}}$. All I/Os are tristated when a write is detected, even a byte write. Since this is a common I/O device, the asynchronous OE input signal must be deasserted and the I/Os must be tristated prior to the presentation of data to $\mathrm{DQ}_{\mathrm{s}}$. As a safety precaution, the data lines are tristated after a write cycle is detected, regardless of the state of OE.

## Burst Sequences

The CY7C1325G provides an on-chip two bit wraparound burst counter inside the SRAM. The burst counter is fed by $\mathrm{A}_{[1: 0]}$, and can follow either a linear or interleaved burst order. The burst order is determined by the state of the MODE input. A LOW on MODE selects a linear burst sequence. A HIGH on MODE selects an interleaved burst order. Leaving MODE unconnected causes the device to default to a interleaved burst sequence.

## Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. CEs, $\overline{\mathrm{ADSP}}$, and $\overline{\mathrm{ADSC}}$ must remain inactive for the duration of $\mathrm{t}_{\text {ZZREC }}$ after the ZZ input returns LOW.

## Notes

1. $X=$ "Don't Care." $H=$ Logic $H I G H, L=$ Logic LOW.
2. $\overline{\text { WRITE }}=L$ when any one or more Byte Write enable signals $\left(\overline{B W}_{A}, \overline{B W}_{B}\right)$ and $\overline{B W E}=L$ or $\overline{\mathrm{GW}}=\mathrm{L} . \overline{\mathrm{WRITE}}=\mathrm{H}$ when all Byte write enable signals $\left(\overline{\mathrm{BWW}}_{\mathrm{A}}, \overline{\mathrm{BW}}_{\mathrm{B}}\right)$, BWE, GW = H
3. The DQ pins are controlled by the current cycle and the $\overline{O E}$ signal. $\overline{O E}$ is asynchronous and is not sampled with the clock.
4. The SRAM always initiates a read cycle when $\overline{\operatorname{ADSP}}$ is asserted, regardless of the state of $\overline{\mathrm{GW}}, \overline{\mathrm{BWE}}$, or $\overline{\mathrm{BW}}_{[A}$ : B]. Writes may occur only on subsequent clocks after the ADSP or with the assertion of ADSC. As a result, OE must be driven HIGH prior to the start of the write cycle to allow the outputs to tristate. OE is a don't care for the remainder of the write cycle.
5. $\overline{\mathrm{OE}}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tristate when $\overline{\mathrm{OE}}$ is inactive or when the device is deselected, and all data bits behave as output when $\overline{O E}$ is active (LOW).

## Truth Table for Read/Write

The Truth Table for Read/Write for part CY7C1325G is as follows. ${ }^{[6]}$

| Function | $\overline{\mathbf{G W}}$ | $\overline{\mathbf{B W E}}$ | $\overline{\mathbf{B W}}_{\mathbf{B}}$ | $\overline{\mathbf{B W}}_{\mathbf{A}}$ |
| :--- | :---: | :---: | :---: | :---: |
| Read | H | H | X | X |
| Read | H | L | H | H |
| Write byte $\mathrm{A}-\left(\mathrm{DQ}_{\mathrm{A}}\right.$ and $\left.\mathrm{DQP}_{\mathrm{A}}\right)$ | H | L | H | L |
| Write byte $\mathrm{B}-\left(\mathrm{DQ}_{\mathrm{B}}\right.$ and $\left.\mathrm{DQP}_{\mathrm{B}}\right)$ | H | L | L | H |
| Write all bytes | H | L | L | L |
| Write all bytes | L | X | X | X |

Note
6. $\mathrm{X}=$ "Don't Care." H = Logic HIGH, L = Logic LOW.

CY7C1325G

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.
Storage temperature $\qquad$ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient temperature with
power applied ......................................... $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Supply voltage on $V_{D D}$ relative to GND $\qquad$ -0.5 V to +4.6 V

Over the Operating Range

| Parameter ${ }^{[7, ~ 8]}$ | Description | Test Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{I}_{\text {SB1 }}$ | Automatic CE power-down current - TTL inputs | Max $V_{\mathrm{DD}}$, device deselected, $V_{I N} \geq V_{I H}$ or $V_{I N} \leq V_{I L}, f=f_{M A X}$, inputs switching | $\begin{aligned} & 7.5 \mathrm{~ns} \text { cycle, } \\ & 133 \mathrm{MHz} \end{aligned}$ | - | 90 | mA |
| $\mathrm{I}_{\text {SB2 }}$ | Automatic CE power-down current - CMOS inputs | Max $V_{D D}$, device deselected, <br> $\mathrm{V}_{\mathrm{IN}} \geq \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}$ or $\mathrm{V}_{\mathrm{IN}} \leq 0.3 \mathrm{~V}$, <br> $\mathrm{f}=0$, inputs static | $\begin{aligned} & 7.5 \text { ns cycle, } \\ & 133 \mathrm{MHz} \end{aligned}$ | - | 40 | mA |
| $\mathrm{I}_{\text {SB3 }}$ | Automatic CE power-down current - CMOS inputs | Max $V_{D D}$, device deselected, <br> $\mathrm{V}_{\mathrm{IN}} \geq \mathrm{V}_{\mathrm{DDQ}}-0.3 \mathrm{~V}$ or $\mathrm{V}_{\text {IN }} \leq 0.3 \mathrm{~V}$, <br> $\mathrm{f}=\mathrm{f}_{\mathrm{MAX}}$, inputs switching | $\begin{aligned} & \text { 7.5 ns cycle, } \\ & 133 \mathrm{MHz} \end{aligned}$ | - | 75 | mA |
| $\mathrm{I}_{\text {SB4 }}$ | Automatic CE power-down current - TTL inputs | Max $V_{D D}$, device deselected, <br> $\mathrm{V}_{\mathrm{IN}} \geq \mathrm{V}_{\mathrm{DD}}-0.3 \mathrm{~V}$ or $\mathrm{V}_{\mathrm{IN}} \leq 0.3 \mathrm{~V}$, <br> $\mathrm{f}=0$, inputs static | $\begin{aligned} & 7.5 \text { ns cycle, } \\ & 133 \mathrm{MHz} \end{aligned}$ | - | 45 | mA |

## Capacitance

| Parameter ${ }^{[9]}$ | Description | Test Conditions | 100-pin TQFP <br> Max | Unit |
| :--- | :--- | :--- | :--- | :---: |
| $\mathrm{C}_{I N}$ | Input capacitance | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{f}=1 \mathrm{MHz}$, | 5 | pF |
| $\mathrm{C}_{\mathrm{CLK}}$ | Clock input capacitance | $\mathrm{V}_{\mathrm{DD}}=3.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{DDQ}}=3.3 \mathrm{~V}$ | 5 | pF |
| $\mathrm{C}_{\mathrm{I} / \mathrm{O}}$ | Input/Output capacitance |  | 5 | pF |

## Thermal Resistance

| Parameter ${ }^{[9]}$ | Description | 100-pin TQFP <br> Package | Unit |  |
| :--- | :--- | :--- | :---: | :---: |
| $\Theta_{\mathrm{JA}}$ | Thermal resistance <br> (junction to ambient) | Test conditions follow standard test methods and <br> procedures for measuring thermal impedance, per | 30.32 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | EIA/JESD51. | 6.85 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |  |
| $\Theta_{\mathrm{JC}}$ | Thermal resistance <br> (junction to case) |  |  |  |

## Timing Diagrams

Figure 3. Read Cycle Timing ${ }^{\text {[16] }}$

Note
16. On this diagram, when $\overline{\mathrm{CE}}$ is LOW: $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW . When $\overline{\mathrm{CE}}$ is HIGH : $\overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH .

## Timing Diagrams (continued)

Figure 4. Write Cycle Timing ${ }^{[17,18]}$

## Notes

17. On this diagram, when $\overline{\mathrm{CE}}$ is LOW: $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW. When $\overline{\mathrm{CE}}$ is HIGH : $\overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH .
18. Full width write can be initiated by either GW LOW; or by $\overline{G W}$ HIGH, $\overline{\mathrm{BWE}}$ LOW and $\overline{\mathrm{BW}}_{[A: B]}$ LOW.

## Timing Diagrams (continued)

Figure 5. Read/Write Timing $\left.{ }^{[19,} 20,21\right]$

1.00 REF. DETAILA

## Acronyms

| Acronym | Description |
| :--- | :--- |
| CMOS | complementary metal oxide semiconductor |
| $\overline{\mathrm{CE}}$ | chip enable |
| $\overline{\mathrm{CEN}}$ | clock enable |
| EIA | electronic industries alliance |
| I/O | input/output |
| JEDEC | joint electron devices engineering council |
| $\overline{\mathrm{OE}}$ | output enable |
| SRAM | static random access memory |
| TQFP | thin quad flat pack |
| TTL | transistor-transistor logic |
| $\overline{\text { WE }}$ | write enable |

## Document Conventions

## Units of Measure

| Symbol | Unit of Measure |
| :--- | :--- |
| ${ }^{\circ} \mathrm{C}$ | degree Celsius |
| MHz | megahertz |
| $\mu \mathrm{A}$ | microampere |
| mA | milliampere |
| mm | millimeter |
| ms | millisecond |
| mV | millivolt |
| ns | nanosecond |
| $\Omega$ | ohm |
| $\%$ | percent |
| pF | picofarad |
| V | volt |
| W | watt |

## Document History Page

Document Title: CY7C1325G, 4-Mbit (256 K $\times$ 18) Flow-Through Sync SRAM
Document Number: 38-05518

| Rev. | ECN | Orig. of Change | Submission Date | Description of Change |
| :---: | :---: | :---: | :---: | :---: |
| ** | 224366 | RKF | See ECN | New data sheet. |
| *A | 283775 | VBL | See ECN | Updated Features (Removed 66 MHz frequency related information). <br> Updated Selection Guide (Removed 66 MHz frequency related information). <br> Updated Electrical Characteristics (Removed 66 MHz frequency related information). <br> Updated Switching Characteristics (Removed 66 MHz frequency related information). <br> Updated Ordering Information (Updated part numbers (Removed 66 MHz frequency related information, changed TQFP package to Pb-Free TQFP, added BG Pb-Free package)). |
| *B | 333626 | SYT | See ECN | Updated Features (Removed 117 MHz frequency related information). <br> Updated Selection Guide (Removed 117 MHz frequency related information). <br> Updated Pin Configurations (Modified Address Expansion balls in the pinouts for 100-pin TQFP and 119-ball BGA Packages as per JEDEC standards). <br> Updated Pin Definitions. <br> Updated Functional Overview (Updated ZZ Mode Electrical Characteristics (Replaced "Snooze" with "Sleep")). <br> Updated Truth Table (Replaced "Snooze" with "Sleep"). <br> Updated Electrical Characteristics (Updated Test Conditions of $\mathrm{V}_{\mathrm{OL}}, \mathrm{V}_{\mathrm{OH}}$ parameters, removed 117 MHz frequency related information). <br> Updated Thermal Resistance (Replaced values of $\Theta_{J A}$ and $\Theta_{J C}$ parameters from TBD to their respective values). <br> Updated Switching Characteristics (Removed 117 MHz frequency related information). <br> Updated Ordering Information (By shading and unshading MPNs as per availability, changed the package name for 100-pin TQFP from A100RA to A101, removed comment on the availability of BG Pb-Free package). |
| *C | 418633 | RXU | See ECN | Changed status from Preliminary to Final. <br> Changed address of Cypress Semiconductor Corporation from " 3901 North First Street" to "198 Champion Court" <br> Updated Electrical Characteristics (Updated Note 8 (Modified test condition from <br> $V_{D D Q}<V_{D D}$ to $V_{D D Q} \leq V_{D D}$, changed "Input Load Current except $Z Z$ and MODE" to "Input Leakage Current except ZZ and MODE"). <br> Updated Ordering Information (Updated part numbers, replaced Package Name column with Package Diagram in the Ordering Information table). <br> Updated Package Diagrams (spec 51-85050 (changed revision from *A to *B)). |
| *D | 480124 | VKN | See ECN | Updated Maximum Ratings (Added the Maximum Rating for Supply Voltage on $V_{\text {DDQ }}$ Relative to GND). <br> Updated Ordering Information (Updated part numbers). |
| *E | 2756998 | VKN | 08/28/09 | Added Neutron Soft Error Immunity. <br> Updated Ordering Information (By including parts that are available, and modified the disclaimer for the Ordering information). |
| *F | 3036073 | NJY | 09/22/2010 | Added Ordering Code Definitions. Updated Package Diagrams. Added Acronyms and Units of Measure. Minor edits and updated in new template. |
| *G | 3052903 | NJY | 10/08/10 | Updated Ordering Information (Removed the following pruned part from the ordering information table namely CY7C1325G-100AXI). |
| *H | 3208774 | NJY | 03/29/2011 | Updated Ordering Information (Updated part numbers). Updated Package Diagrams. |

Use may be limited by and subject to the applicable Cypress software license agreement.

[^0]:    Notes
    7. Overshoot: $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})}<\mathrm{V}_{\mathrm{DD}}+1.5 \mathrm{~V}$ (Pulse width less than $\mathrm{t}_{\mathrm{CYC}} / 2$ ), undershoot: $\mathrm{V}_{\mathrm{IL}(\mathrm{AC})}>-2 \mathrm{~V}$ (Pulse width less than $\mathrm{t}_{\mathrm{CYC}} / 2$ )
    8. $T_{\text {power up }}$ : Assumes a linear ramp from 0 V to $V_{D D(\text { min })}$ within 200 ms . During this time $V_{I H}<V_{D D}$ and $V_{D D Q} \leq V_{D D}$.

[^1]:    Note
    9. Tested initially and after any design or process change that may affect these parameters.

[^2]:    Notes
    10. Timing reference level is 1.5 V when $\mathrm{V}_{\mathrm{DDQ}}=3.3 \mathrm{~V}$ and is 1.25 V when $\mathrm{V}_{\mathrm{DDQ}}=2.5 \mathrm{~V}$.
    11. Test conditions shown in (a) of Figure 2 on page 11 unless otherwise noted.
    12. This part has a voltage regulator internally; $t_{\text {POWER }}$ is the time that the power needs to be supplied above $V_{D D(m i n i m u m)}$ initially before a read or write operation can be initiated.
    13. $t_{C H Z}, t_{C L Z}, t_{O E L Z}$, and $t_{O E H Z}$ are specified with $A C$ test conditions shown in part (b) of Figure 2 on page 11 . Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.
    14. At any voltage and temperature, $\mathrm{t}_{\mathrm{OEHz}}$ is less than $\mathrm{t}_{\mathrm{OELZ}}$ and $\mathrm{t}_{\mathrm{CHZ}}$ is less than $\mathrm{t}_{\mathrm{CLZ}}$ to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.
    15. This parameter is sampled and not $100 \%$ tested.

[^3]:    Notes
    19. On this diagram, when $\overline{\mathrm{CE}}$ is LOW: $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW. When $\overline{\mathrm{CE}}$ is $\mathrm{HIGH}: \overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH . 20. The data bus ( $Q$ ) remains in High $Z$ following a WRITE cycle, unless a new read access is initiated by ADSP or $\overline{\text { ADSC }}$. 21. $\overline{\mathrm{GW}}$ is HIGH .

[^4]:    Notes
    22. Device must be deselected when entering $Z Z$ mode. See Cycle Descriptions table for all possible signal conditions to deselect the device. 23. DQs are in High $Z$ when exiting $Z Z$ sleep mode.
