

N-P-N TYPES 2N1302, 2N1304, 2N1306, AND 2N1308 ALLOY-JUNCTION GERMANIUM TRANSISTORS

High-Frequency Transistors for Computer and Switching Applications

environmental tests

To ensure maximum integrity, stability, and long life, finished devices are subjected to the following tests and conditions prior to thorough testing for rigid adherence to specified characteristics.

- All devices receive a 100°C stabilization bake for 100 hours.
- The hermetic seal for all devices is verified by helium leak testing.
- Production samples are life tested at regularly scheduled periods to ensure maximum reliability under extreme operating conditions.
- Continuous Quality Control checks on in-process assembly are maintained.

***mechanical data**

The transistors are in a JEDEC TO-5 hermetically sealed welded package with glass to metal seal between case and leads. Approximate weight is one gram.

***absolute maximum ratings at 25°C free-air temperature (unless otherwise noted)**

† V_{PT} is determined by measuring the emitter-base floating potential V_{EB1} . The collector-base voltage, V_{CB} , is increased until $V_{EB1} = 1$ volt; this value of $V_{CB} = (V_{PT} + 1 \text{ v})$.
