TYPICAL CHARECTERISTICS

TYPICAL APPLICATION CIRCUIT

Note:

1. The regulator proposed to establish the input voltage by soft-start, no plug and play, if the input voltage changes from low voltage to high voltage abruptly, the regulator might be damaged.
2. If the applications is high-voltage input, the regulator must add an external capacitor C1($\leq 47\mu\text{F}/100\text{V}$),to prevent voltage spikes caused by damage to the module.
3. No parallel connection.

APPLICATION EXAMPLE

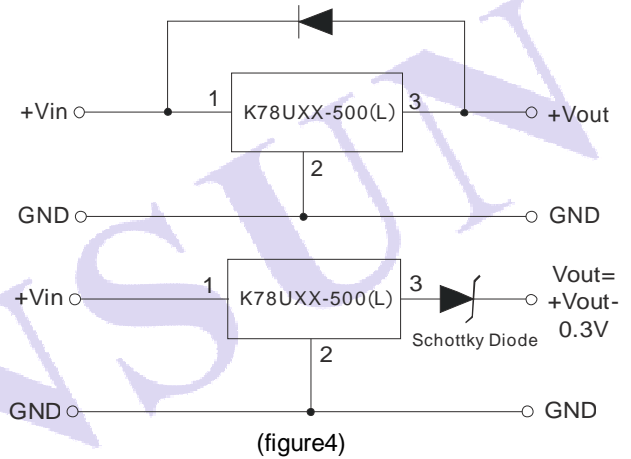

High voltage input, Multiple Outputs, with greater load

Note:

1. the input current amount of the back-grade regulator and the pre-class load should be less than or equal the max load current of the pre-class regulator.
2. If further filtering is required, please add components as per the above circuit(We recommend not to add components), if request, please make sure the capacitors C1 $\leq 47\mu\text{F}$, C2 $\leq 10\mu\text{F}$ more close to the back-grade regulator.

Note:

1. The load shouldn't be less than 10%, and the output external capacitor should not be too large (recommend $<10\mu\text{F}$), otherwise ripple will increase dramatically.
2. Operation under 10% load will not damage the converter; However, they may not meet all specification listed
3. All specifications measured at $T_a=25^\circ\text{C}$, humidity $<75\%$, nominal input voltage and rated output load unless otherwise specified.
4. In this datasheet, all the test methods of indications are based on corporate standards.
