- Each Device Drives Ten Lines
- 60-V Output Voltage Rating
- 40-mA Output Source Current
- High-Speed Serially-Shifted Data Input
- CMOS-Compatible Inputs
- Latches on All Driver Outputs
- Improved Direct Replacement for UCN4810A and TL4810A

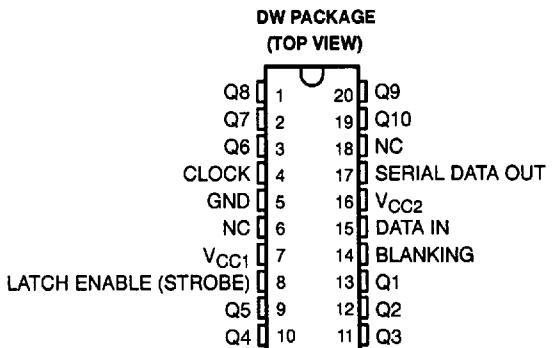

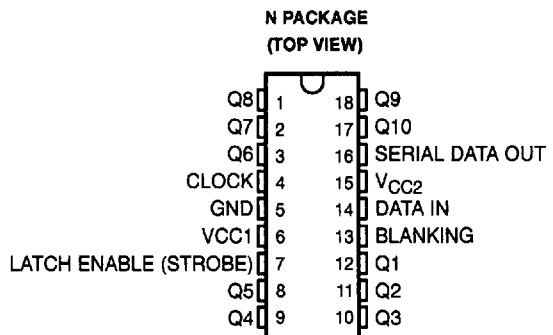

description

The TL4810B and TL4810BI are monolithic BIDFET[†] integrated circuits designed to drive a dot matrix or segmented vacuum fluorescent display (VFD). These devices feature a serial data output to cascade additional devices for large display arrays.

A 10-bit data word is serially loaded into the shift register on the positive-going transitions of the clock. Parallel data is transferred to the output buffers through a 10-bit D-type latch while LATCH ENABLE is high and is latched when LATCH ENABLE is low. When BLANKING is high, all outputs are low.

Outputs are totem-pole structures formed by npn emitter-follower and double-diffused MOS (DMOS) transistors with output voltage ratings of 70 V and 40-mA source-current capability. All inputs are compatible with CMOS and TTL levels, but each requires the addition of a pullup resistor to V_{CC1} when driven by TTL logic.

The TL4810B is characterized for operation from 0°C to 70°C. The TL4810BI is characterized for operation from -40°C to 85°C.

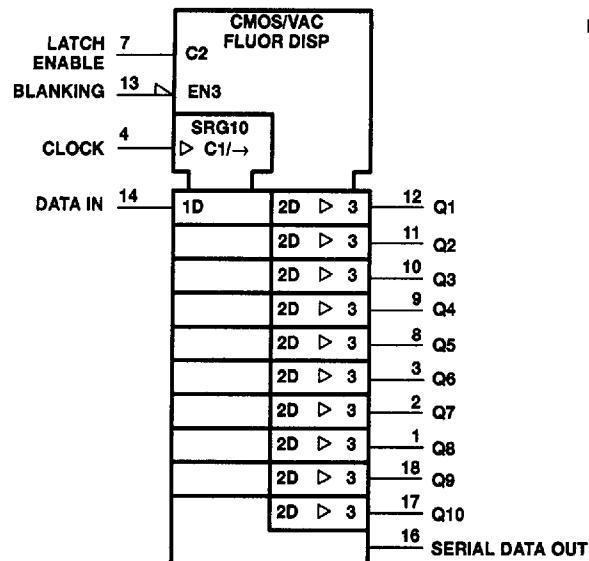

NC—No internal connection

[†]BIDFET — Bipolar, double-diffused, N-channel and P-channel MOS transistors on same chip. This is a patented process.

H = high level, L = low level, X = irrelevant, ↑ = low-to-high-level transition.

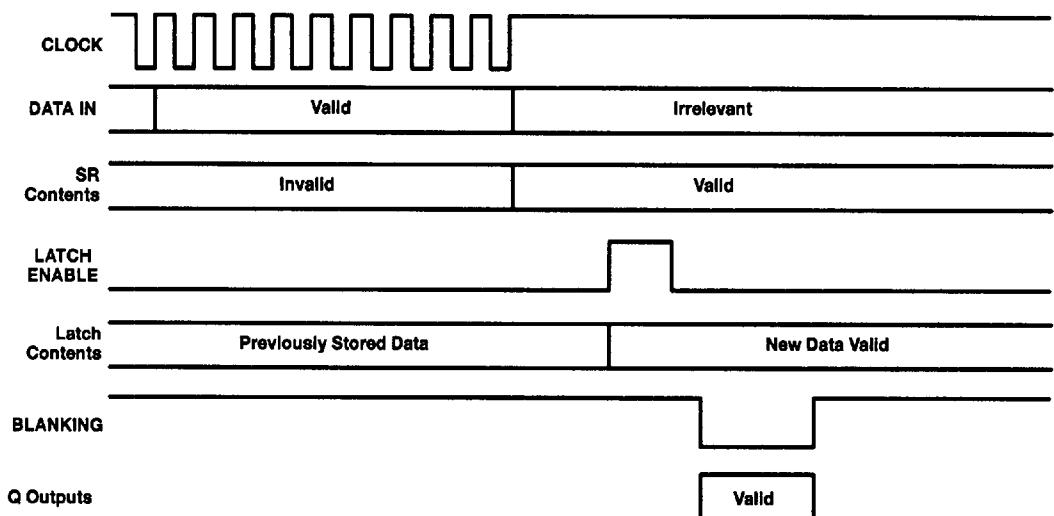

‡ Register R10 takes on the state of R9, R9 takes on the state of R8...R2 takes on the state of R1, and R1 takes on the state of the data input.

§ New data enter the latches while LATCH ENABLE is high. These data are stored while LATCH ENABLE is low.
