

Features

- Temperature ranges
 - Industrial: -40 °C to 85 °C
 - Automotive-A: -40 °C to 85 °C
 - Automotive-E: -40 °C to 125 °C
- Pin and function compatible with CY7C1011BV33
- High speed
 - $t_{AA} = 10$ ns (Industrial and Automotive-A)
 - $t_{AA} = 12$ ns (Automotive-E)
- Low active power
 - 360 mW (max) (Industrial and Automotive-A)
- 2.0 V data retention
- Automatic power down when deselected
- Independent control of upper and lower bits
- Easy memory expansion with Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) features
- Available in Pb-free 44-pin thin small outline package (TSOP) II, 44-pin thin quad flat package (TQFP), and non Pb-free 48-ball very fine-pitch ball grid array (VFBGA) packages

Functional Description

The CY7C1011CV33 is a high performance complementary metal oxide semiconductor (CMOS) static RAM organized as 131,072 words by 16 bits. This device has an automatic power down feature that significantly reduces power consumption when deselected.

To write to the device, take \overline{CE} and Write Enable (\overline{WE}) inputs LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O₀ through I/O₇) is written into the location specified on the address pins (A₀ through A₁₆). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A₀ through A₁₆).

To read from the device, take \overline{CE} and \overline{OE} LOW while forcing the Write Enable (\overline{WE}) HIGH. If BLE is LOW, then data from the memory location specified by the address pins appear on I/O₀ to I/O₇. If BHE is LOW, then data from memory appears on I/O₈ to I/O₁₅. For more information, see the [Truth Table on page 10](#) for a complete description of Read and Write modes.

The input and output pins (I/O₀ through I/O₁₅) are placed in a high impedance state when the device is deselected (CE HIGH), the outputs are disabled (OE HIGH), the BHE and BLE are disabled (BHE, BLE HIGH), or during a write operation (CE LOW and WE LOW).

Notes

5. Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5 V, and input pulse levels of 0 to 3.0 V.
6. t_{POWER} gives the minimum amount of time that the power supply is at typical V_{CC} values until the first memory access is performed.
7. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
8. t_{HZOE} , t_{HZBE} , t_{HZCE} , and t_{HZWE} are specified with a load capacitance of 5 pF as in part (d) of Figure 4 on page 6. Transition is measured ±500 mV from steady state voltage.
9. The internal write time of the memory is defined by the overlap of CE LOW, WE LOW, and BHE/BLE LOW. CE, WE, and BHE/BLE must be LOW to initiate a write. The transition of these signals terminate the write. The input data setup and hold timing is referenced to the leading edge of the signal that terminates the write.
10. The minimum write cycle time for Write Cycle No. 3 (WE controlled, OE LOW) is the sum of t_{HZWE} and t_{SD} .

Notes

11. Device is continuously selected. \overline{OE} , \overline{CE} , \overline{BHE} , and/or $\overline{BLE} = V_{IL}$.
12. WE is HIGH for read cycle.
13. Address valid prior to or coincident with \overline{CE} transition LOW.

Notes

14. Data I/O is high impedance if \overline{OE} , \overline{BHE} , and/or $\overline{BLE} = V_{IH}$.

15. If CE goes HIGH simultaneously with WE going HIGH, the output remains in a high impedance state.
