A. The value of R$_{θJA}$ is measured with the device in a still air environment with T$_A$ =25℃.

B. The power dissipation P$_D$ is based on T$_{J(MAX)}$=150℃, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

C. Repetitive rating, pulse width limited by junction temperature T$_{J(MAX)}$=150℃, Ratings are based on low frequency and duty cycles to keep initial T$_J$ =25℃.

D. The R$_{θJA}$ is the sum of the thermal impedence from junction to case R$_{θJC}$ and case to ambient.

E. The static characteristics in Figures 1 to 6 are obtained using <300 µs pulses, duty cycle 0.5% max.

F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of T$_{J(MAX)}$=150℃. The SOA curve provides a single pulse ratin g.

G. L=60mH, I$_{AS}$=3A, V$_{DD}$=150V, R$_G$=25Ω, Starting T$_J$=25℃
