

## 1. Features

- 16 channels constant current output.
- Constant output current is to set up external resistor.  
 $I_{out} = 5mA \sim 90mA$   
Constant current output voltage :  $V_o = 17V(\text{Max})$
- Excellent output current accuracy :  
between outputs : +/- 1%(typ)  
between devices : +/- 3%(typ)
- Control data method : serial-in, parallel out.
- Data transfer frequency :  $f_{max} = 25\text{Mhz}$
- Operating voltage range :  $V_{dd} = 4.5\sim 5.5V$
- Operating temperature range :  $T_{op} = -40 \sim 85^{\circ}\text{C}$
- 20ns delay of output to lower bouncing noise.
- Schmitt trigger input.
- Pb free Package : LSD9016-X24T SSOP24-150 - 0.64  
LSD9016-X24S SOP24L- 300 - 1.0  
LSD9016-X24W SOP24 - 375- 1.27

## 2. Description

The LSD9016 is a constant current LED driver for lighting application. It has sixteen regulated current ports to provide uniform and constant current sink for driving LEDs within a large range of  $V_f$  variations.

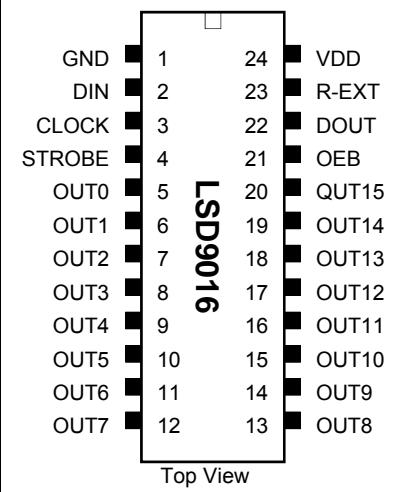

A user may adjust the output current from 5mA to 90mA through an external resistor and can control LED brightness via OEB input, too. The duty cycle of OEB can decide the brightness intensity from 0% to 100%.

## 3. Application

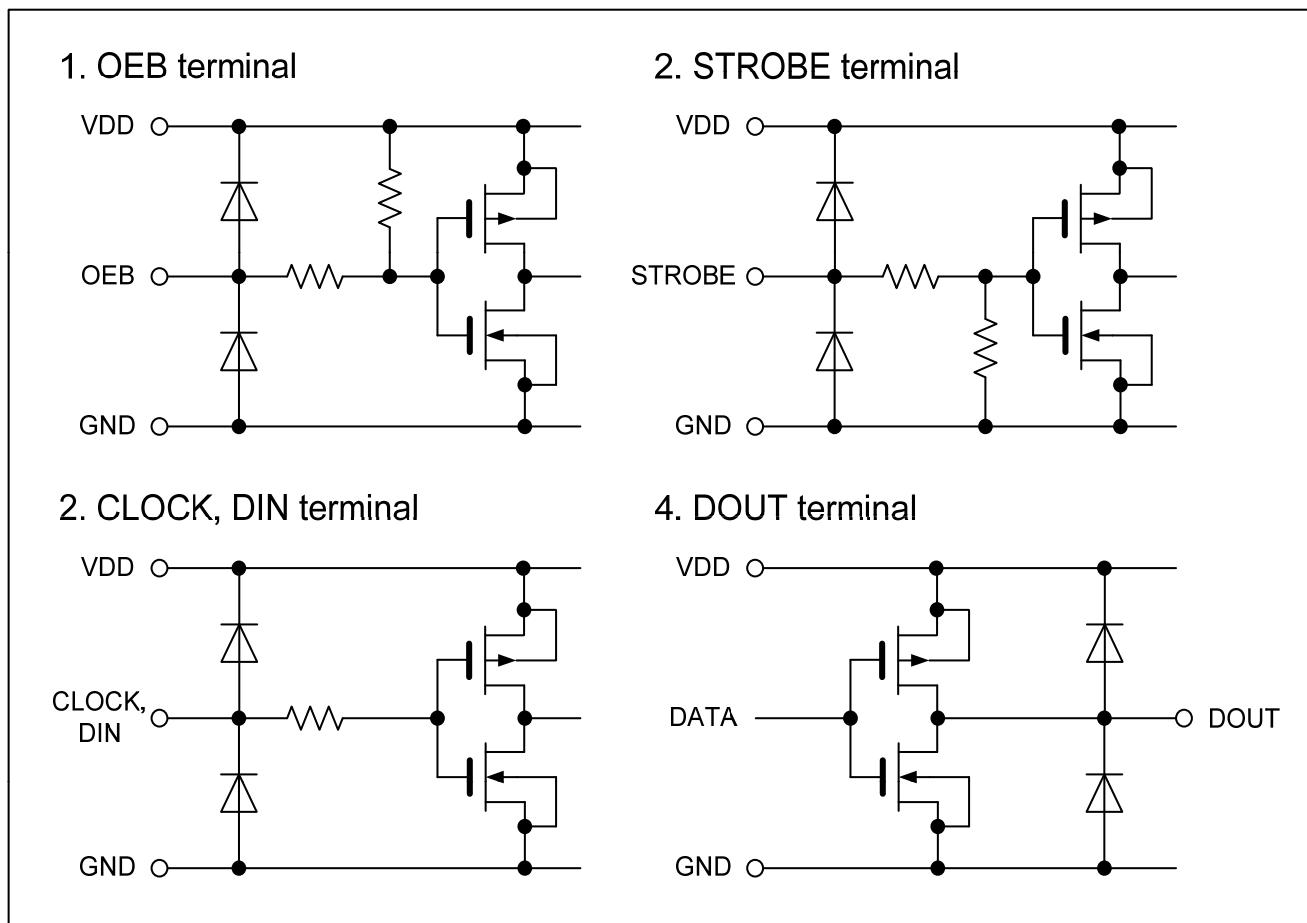

- Automotive interior LED lighting driver.
- Decoration lighting.
- Traffic sign
- Video wall
- A signboard

#### 4. Pin Description

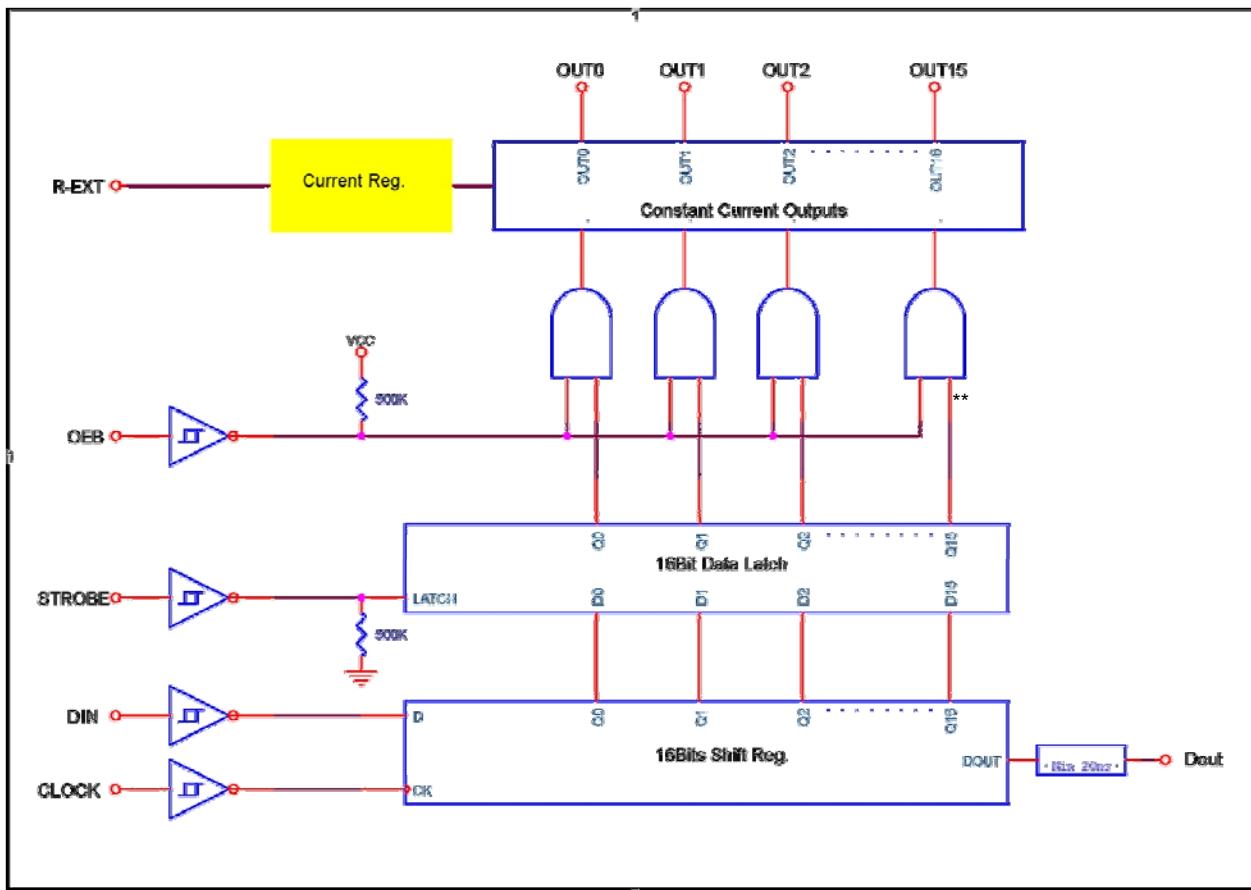

PIN NO	PAD NAME	DESCRIPTION
1	GND	GND terminal for logic and current sink.
2	DIN	Serial data input terminal for Internal shift register.
3	CLOCK	Clock input terminal for internal shift register. Serial data is captured at rising edge of this input.
4	STROBE	Data strobe terminal for internal data latch.
24	VDD	Power supply terminal( 4.5V ~ 5.5V)
5~20	OUTn	Output terminal for External LED.
21	OEB	Output enable input terminal. OUTn pin outputs when this input at "L" level
22	DOUT	Serial data output terminal for external device.
23	R-EXT	Input terminal for external RESISTER The resister which connects between R-EXT and GND sets a output current on OUTn terminal.

#### 5. Equivalent Circuit of input and output

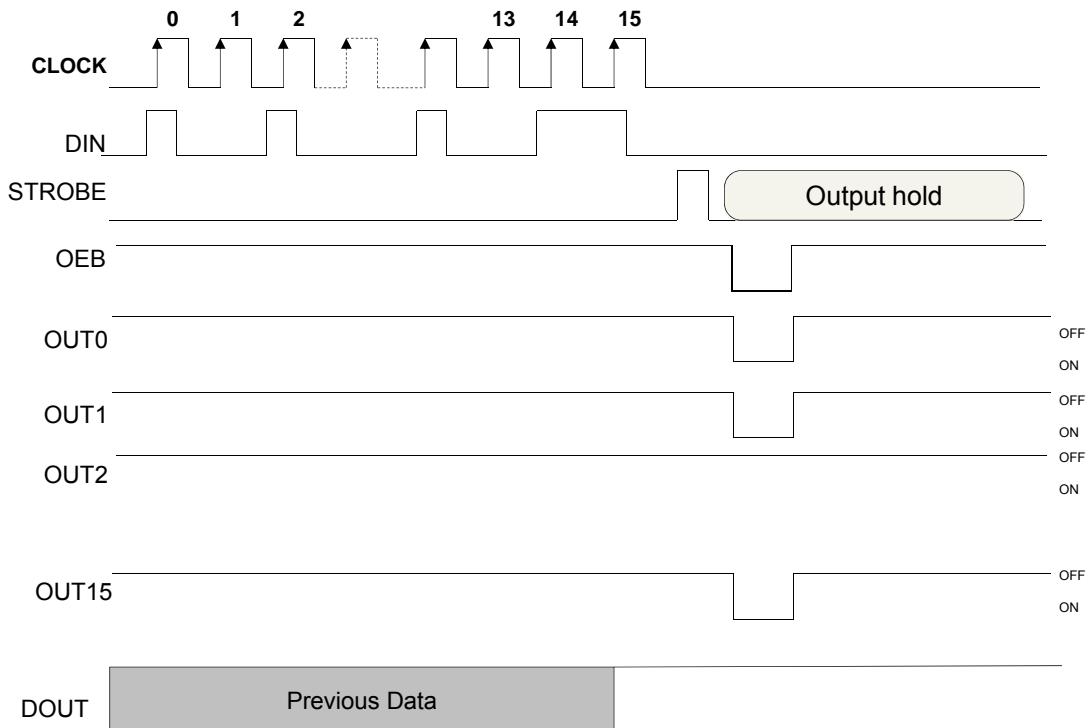

## 6. Block Diagram

### < Truth Table >

CLOCK	STROBE	OEB	DIN	OUT0~15	DOUT
↑	H	L	Dn	Dn Dn-1 ----- Dn-14 Dn-15	Dn-15
↑	L	L	Dn+1	No Change	Dn-14
↑	H	L	Dn+2	Dn+2 Dn+1 ..... Dn-12 Dn-13	Dn-13
↓	X	L	Dn+3	Dn+2 Dn+1 ..... Dn-12 Dn-13	Dn-13
↓	X	H	Dn+3	All outputs are off	Dn-13

## 7. Timing Diagram

STROBE are level sensitive ( not edge triggered).

STROBE = "H" level, become transparent STROBE ="L" level hold data

OEB = "H" level , all ouput are off. DOUT is to change on the rising edge of clock..

## 8. Electrical Characteristics

### 8-1. Absolute Maximum Ratings( Ta = 25°C )

PARAMETER	SYMBOL	RATING	UNIT

Output rise time	tor	10 to 90% of voltage wave form	-	30	150	ns	
Output fall time	tof	90 to 10% of voltage wave form	-	70	150	ns	

## 9. Application Information

### < Constant Current >

To keep supply constant current, LSD9016 provides minimum variation in current from channel to channel and chip to chip. The maximum current skew in each channel is less than 3% and less than 6% between ICs

where,  $T_a = 25^\circ\text{C}$   $V_{out} = 1.5\text{V}$   $V_{dd} = 5\text{V}$   $R_{ext} = 1.56\text{k}$

- Conditions :  $V_{out}=1.5\text{V}$  ,  $V_{dd}=5.0\text{V}$ ,  $T_a=25^\circ\text{C}$
- This data is provided for reference only.

### < Adjusting Output Current >

All output CURRENT of LSD9016( $I_{out}$ ) are setting by one external resistor at pin R-EXT. The relative curve between  $I_{out}$  and resistance  $R_{-EXT}$  is shown as the above figure and under table  $I_{out}$  vs  $R_{-EXT}$ .

Also, the output current can be calculated from as below equation approximately.

$$I_{out} \approx V_{ref} / R_{EXT} * 14.8 \quad (\text{for } I_{out} < 60\text{mA}) \quad \text{where, } V_{ref} = 1.22\text{V}$$

$$I_{out} \approx V_{ref} / R_{EXT} * 13.2 \quad (\text{for } I_{out} \geq 60\text{mA})$$

where  $R_{ext}$  in  $\Omega$  is resistance of the external resistor connected to R-EXT terminal.

### < Table “Iout vs R\_EXT” >

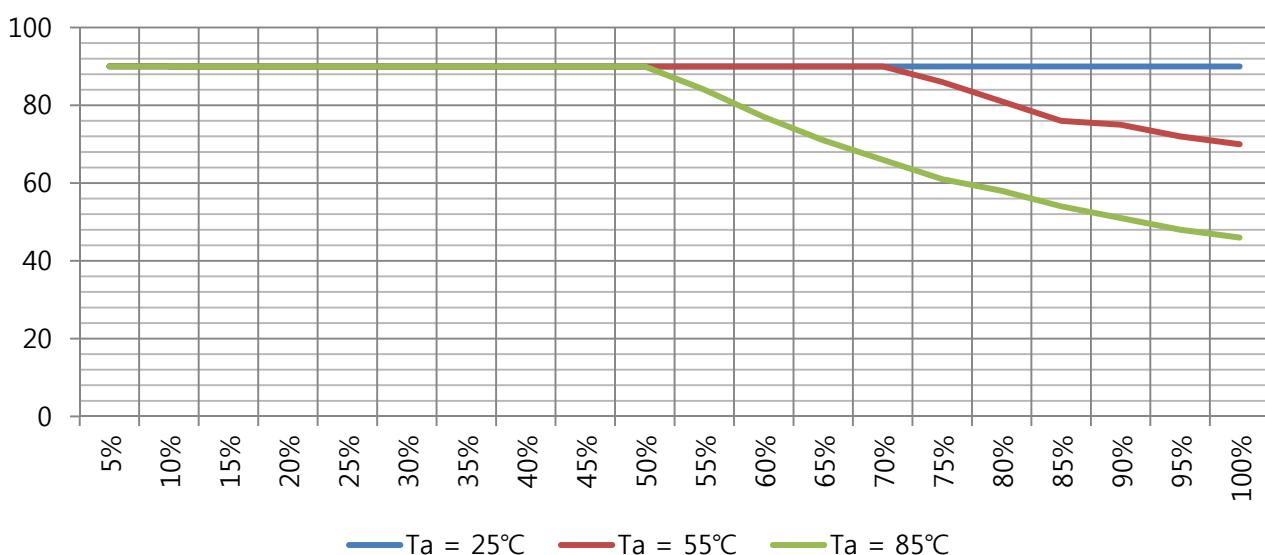

I out ( mA )	R_EXT( Ω )	I out ( mA )	R_EXT( Ω )
20	900	60	300
30	600	70	240
40	450	80	200
50	360	90	180

### < Package Power Dissipation(Pd) >

The maximum allowable package power dissipation is determined as  $Pd(max) = (Tj-Ta)/Rth$   
When 16 output channels are turn on simultaneously, the operating package power dissipation  
is  $Pd(op) = (Idd \times Vdd) + (I_{out} \times duty \times Vout \times 16)$  therefore, to keep  $Pd(op) \leq Pd(max)$  nomally  
the allowable maximum output current "I<sub>out</sub>" is determinated  
 $I_{out} = \{ [(Tj-Ta)/Rth] - (Idd \times Vdd) \} / Vout / duty / 16$ ,  
Where, the T<sub>j</sub> of LSD9016 is 150 °C

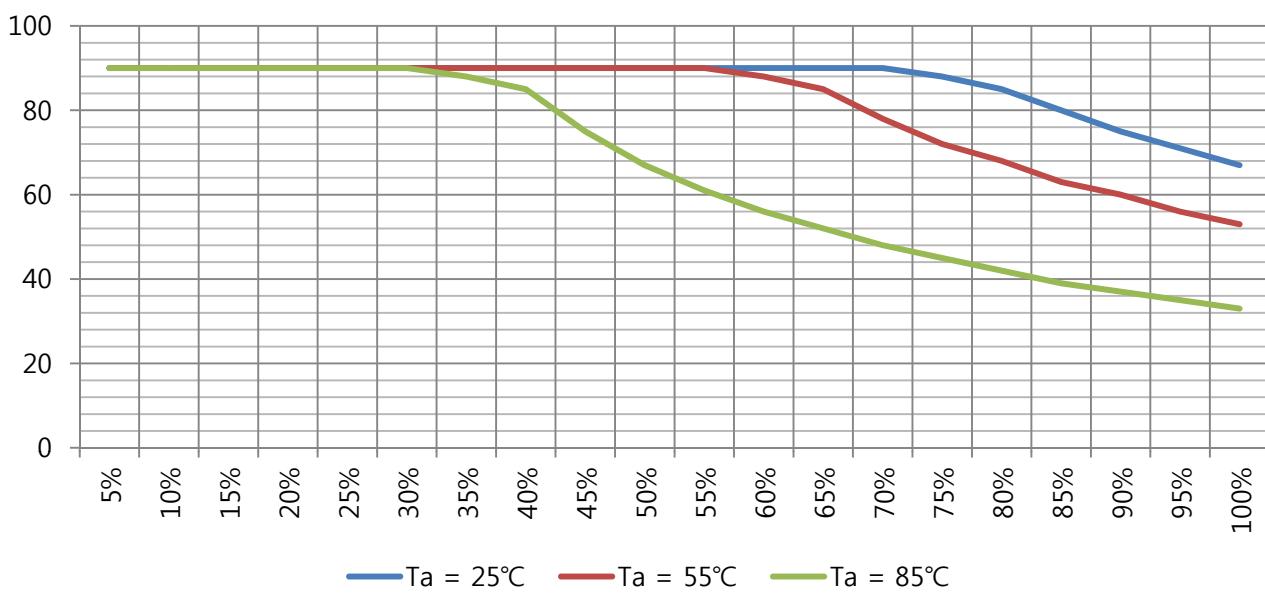

#### (A1) I<sub>out</sub> = 90mA V<sub>out</sub> = 1.0V 16 channel outputs

For SOP24L type package, the thermal resistance is  $Rth = 95(\text{°C/W})$

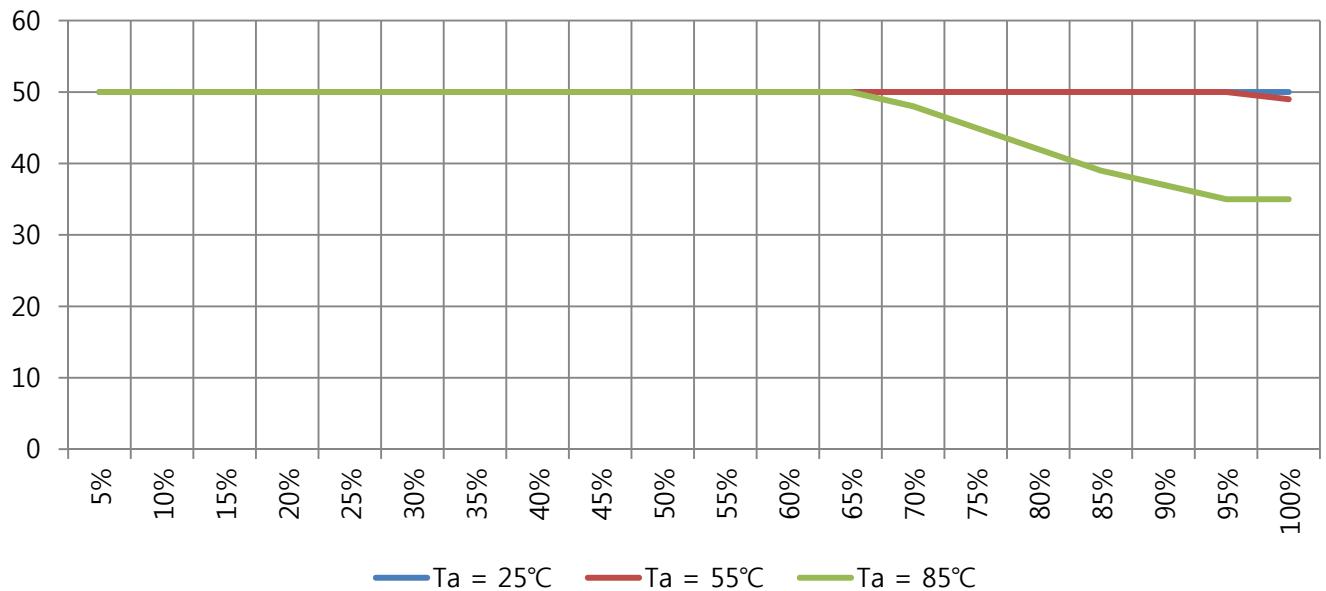

#### (A2) I<sub>out</sub> = 90mA V<sub>out</sub> = 1.0V 16 channel outputs

For SSOP24 type package, the thermal resistance is  $Rth = 110(\text{°C/W})$

**(A2) Iout =50mA Vout = 1.0V 16 channel outputs**

For SSOP24 type package, the thermal resistance is  $R_{th} = 110(\text{°C/W})$

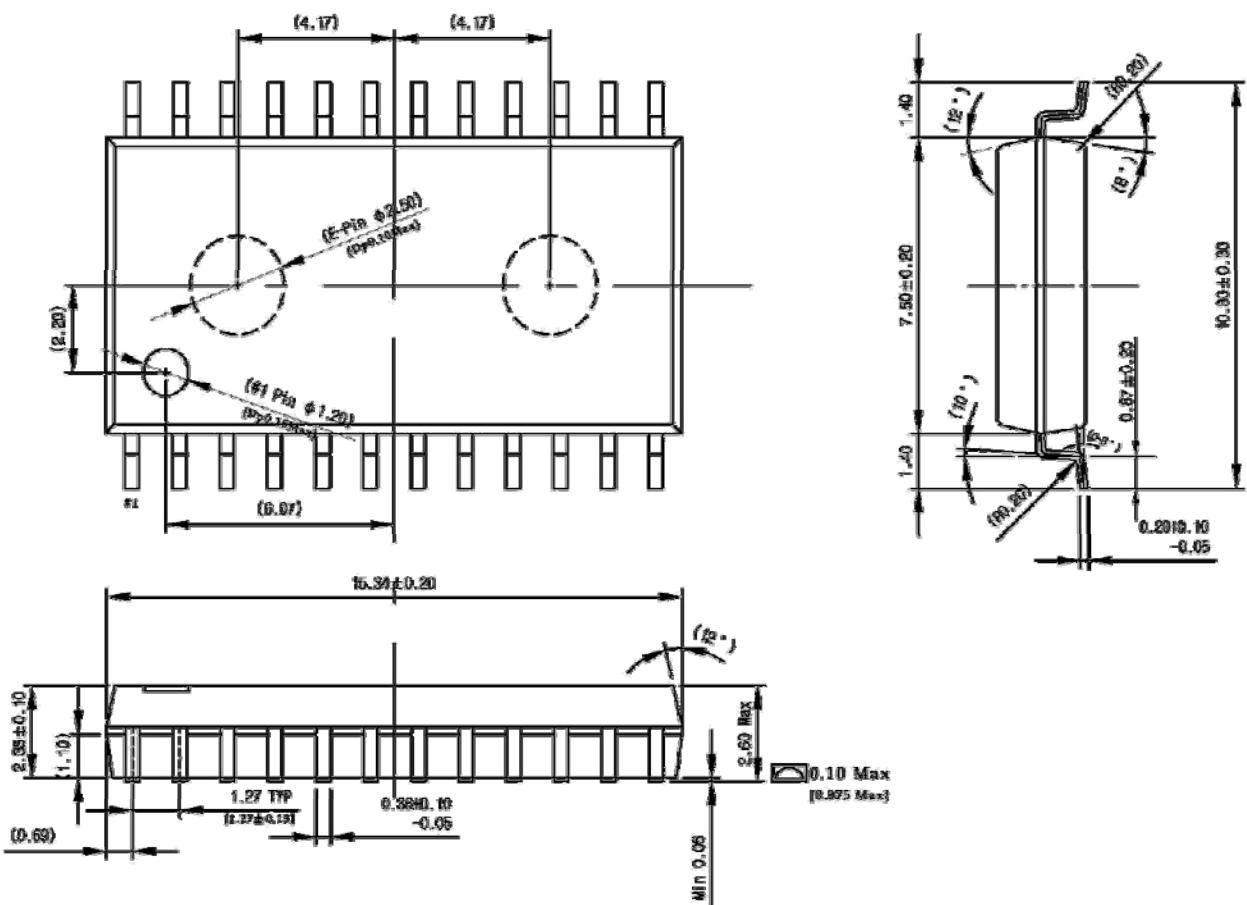

Due to above curve, when SSOP24 type package in operating  $I_{out(max)} = 50\text{mA}$  LSD9016-X24T is advised to choice duty cycle, around 65%.

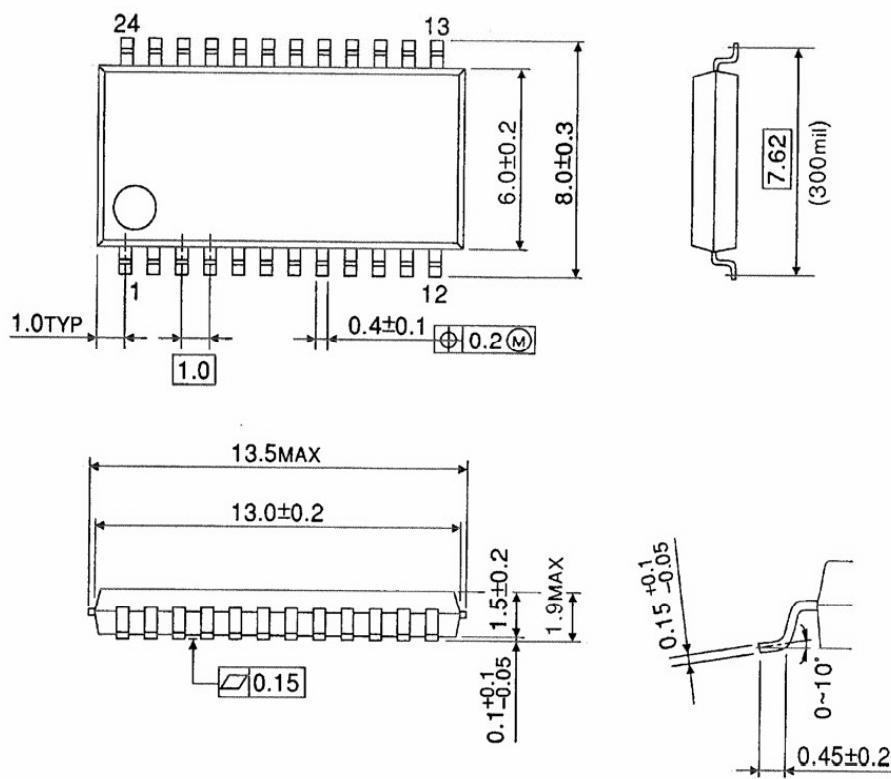

It should be sure to operate more safety.
