

74VCXH2245

Low Voltage Bidirectional Transceiver with Bushold and 26Ω Series Resistors in B Outputs

General Description

The VCXH2245 contains eight non-inverting bidirectional buffers with 3-STATE outputs and is intended for bus oriented applications. The T/\bar{R} input determines the direction of data flow. The \bar{OE} input disables both the A and B Ports by placing them in a high impedance state. The VCXH2245 data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating data inputs at a valid logic level.

The 74VCXH2245 is designed for low voltage (1.4V to 3.6V) V_{CC} applications. The VCXH2245 is also designed with 26Ω series resistance in the B Port outputs. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers transmitters.

The 74VCXH2245 is fabricated with an advanced CMOS technology to achieve high-speed operation while maintaining low CMOS power dissipation.

Features

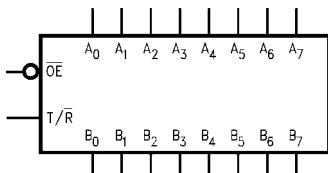

- 1.4V-3.6V V_{CC} supply operation
- 3.6V tolerant control inputs
- Bushold on data inputs eliminates the need for external pull-up/pull-down resistors
- 26Ω series resistors in B Port outputs
- t_{PD} (A to B)
4.4 ns max for 3.0V to 3.6V V_{CC}
- Static Drive (I_{OH}/I_{OL} B outputs):
 ± 12 mA @ 3.0V V_{CC}
- Uses patented Quiet Series™ noise/EMI reduction circuitry
- Latchup performance exceeds 300 mA
- ESD performance:
Human body model > 2000V
Machine model > 200V

Note 1: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: I_O Absolute Maximum Rating must be observed.

Note 3: Floating or unused control inputs must be held HIGH or LOW.
