

FEATURES

DAC

- 24-bit, 8 kHz to 96 kHz sampling frequency
- 96 dB dynamic range, 96 dB signal to noise ratio, -83 dB THD+N
- 40 mW headphone amplifier, pop noise free, capless option
- Stereo enhancement
- Bass and Treble adjustments
- Various analog output mixing and gains

Low Power

- 1.8V to 3.3V operation
- 7 mW playback

System

- I²C or SPI uC interface
- 256Fs, 384Fs, USB 12 MHz or 24 MHz
- Master or slave serial port
- I²S, Left Justified, DSP/PCM Mode
- Fractional PLL for wide range of system clocks

APPLICATIONS

- GPS
- Bluetooth
- MP3, MP4, PMP
- Cell phone
- Digital camera, camcorder
- Portable audio devices

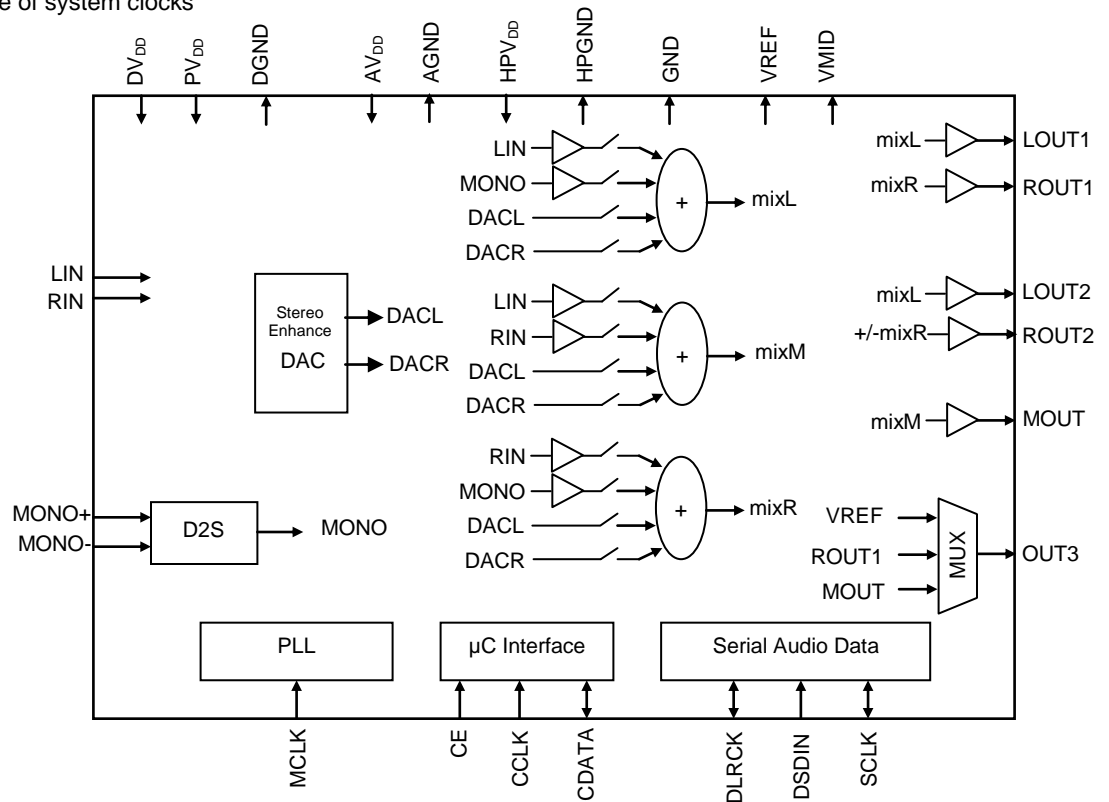

GENERAL DESCRIPTION

PA5155 is a high performance, low power and low cost audio DAC. It consists of 2-ch DAC, headphone amplifier, digital sound effects, and analog mixing and gain functions.

The device uses advanced multi-bit delta-sigma modulation technique to convert data between digital and analog.

The multi-bit delta-sigma modulators make the device with low sensitivity to clock jitter and low out of band noise.

TYPICAL APPLICATION CIRCUIT

CLOCK MODES AND SAMPLING FREQUENCIES

According to the input serial audio data sampling frequency, the device can work in two speed modes: single speed or double speed. The ranges of the sampling frequency in these two modes are listed in Table 1. The device can work either in master clock mode or slave clock mode.

In slave mode, LRCK and SCLK are supplied externally. LRCK and SCLK must be synchronously derived from the system clock with specific rates. The device can auto detect MCLK/LRCK ratio according to Table 1. The device only supports the MCLK/LRCK ratios listed in Table 1. The LRCK/SCLK ratio is normally 64.

Table 1 Slave Mode Sampling Frequencies and MCLK/LRCK Ratio

Speed Mode	Sampling Frequency	MCLK/LRCK Ratio
Single Speed	8kHz – 50kHz	256, 384, 512, 768, 1024
Double Speed	50kHz – 100kHz	128, 192, 256, 384, 512

In master mode, LRCK and SCLK are derived internally from MCLK. The available MCLK/LRCK ratios and SCLK/LRCK ratios are listed in Table 2.

PA5155 has a high performance fractional-N PLL. PLL can be used for non-standard MCLK to generate standard internal master clock, for example 12.288 MHz for 48 kHz sampling frequency or 11.2896 MHz for 44.1 kHz sampling frequency. By default, PLL is in power down and reset, and the internal master clock uses MCLK clock from pin directly. The following table shows the PLL setting (MCLKDIV2, PLL_N, PLL_K and PLLOUT_DIV2) for typical non-standard MCLK to generate standard internal master clock.

MICRO-CONTROLLER CONFIGURATION INTERFACE

The device supports standard SPI and 2-wire micro-controller configuration interface. External micro-controller can completely configure the device through writing to internal configuration registers. Please see section 8 for the details of configuration register definition.

The identical device pins are used to configure either SPI or 2-wire interface. In SPI mode, pin CE, CCLK and CDATE function as SPI_CS_n, SPI_CLK and SPI_DIN. In 2-wire mode, pin CE, CCLK and CDATE function as AD₀, SCL and SDA. To select SPI mode, apply high to low transition signal to CE pin. Otherwise the device will operate in 2-wire interface mode.

SPI

PA5155 has a SPI (Serial Peripheral Interface) compliant synchronous serial slave controller inside the chip. It provides the ability to allow the external master SPI controller to access the internal registers, and thus control the operations of chip.

All lines on the SPI bus are unidirectional: The SPI_CLK is generated by the master controller and is primarily used to synchronize data transfer, the SPI_DIN line carries data from the master to the slave; SPI_CS_n is generated by the master to select PA5155.

The timing diagram of this interface is given in Figure 1. The high to low transition at SPI_CS_n pin indicates the SPI interface selected. Each write procedure contains 3 words, i.e. Chip Address plus R/W bit, internal register address and internal register data. Every word length is fixed at 8 bits. The input SPI_DIN data are sampled at the rising edge of SPI_CLK clock. The MSB bit in each word is transferred firstly. The transfer rate can be up to 10Mbps.

Figure 1 SPI Configuration Interface Timing Diagram

2-WIRE

2-wire interface is a bi-directional serial bus that uses a serial data line (SDA) and a serial clock line (SCL) for data transfer. The timing diagram for data transfer of this interface is given in Figure 2. Data are transmitted synchronously to SCL clock on the SDA line on a byte-by-byte basis. Each bit in a byte is sampled during SCL high with MSB bit being transmitted firstly. Each transferred byte is followed by an acknowledge bit from receiver to pull the SDA low. The transfer rate of this interface can be up to 100k bps.

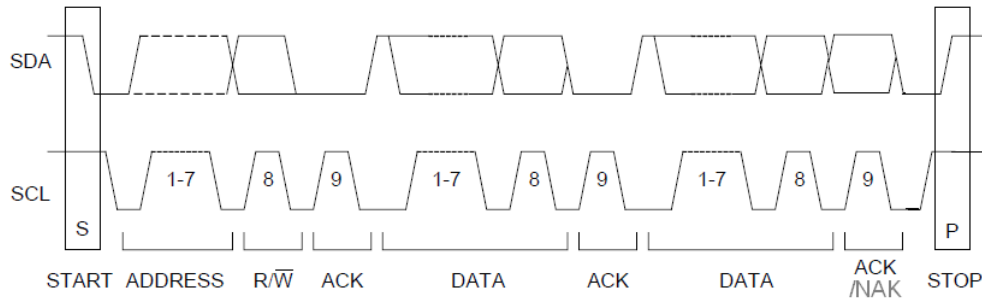

Figure 2 Complete Data Transfer for 2-wire Interface

A master controller initiates the transmission by sending a “start” signal, which is defined as a high-to-low transition at SDA while SCL is high. The first byte transferred is the slave address. It is a seven-bit chip address followed by a RW bit. The chip address must be 001000x, where x equals AD0 (pin CE). The RW bit indicates the slave data transfer direction. Once an acknowledge bit is received, the data transfer starts to proceed on a byte-by-byte basis in the direction specified by the RW bit. The master can terminate the communication by generating a “stop” signal, which is defined as a low-to-high transition at SDA while SCL is high.

In 2-wire interface mode, the registers can be written and read. The formats of “write” and “read” instructions are shown in Table 3 and Table 4. Please note that, to read data from a register, you must set R/W bit to 0 to access the register address and then set R/W to 1 to read data from the register. There are no acknowledge bit after data to be written or read, this is the only difference from the I²C protocol.

CONFIGURATION REGISTER DEFINITION

SPI and 2-wire configuration interface share the same registers because there is only one interface active at any time. There are total of 53 user programmable 8-bit registers in this device. These registers control the operations of DAC. External master controller can access these registers by using the slave address specified in RAM (Register Address Map) register as shown in the Table 5.

DACLVOL	7:0	Left DAC volume control 00000000 – 0 dB ... 0.5 dB/step 11000000 – -127 dB (default)

Register 13 – Right DAC Volume, Default 1100 0000

Bit Name	Bit	Description
DACRVOL	7:0	Right DAC volume control 00000000 – 0 dB ... 0.5 dB/step 11000000 – -127 dB (default)

Register 14 – DAC Control 1, Default 0101 0101

Bit Name	Bit	Description
LP_DAACL	7	0 – normal (default) 1 – low power setting for left DAC
PDN_DAACL	6	0 – not power down 1 – power down left DAC (default)
LP_DACR	5	0 – normal (default) 1 – low power setting for right DAC
PDN_DACR	4	0 – not power down 1 – power down right DAC (default)

DACLMU	2	1 – left DAC mute (default) 0 – left DAC not mute
DACRMU	0	1 – right DAC mute (default) 0 – right DAC not mute

Register 15 – DAC Control 2, Default 1100 0100

Bit Name	Bit	Description
AUTOMUTE	7	Auto mute function: long period of zero inputs (8k audio samples) will mute the analog output. Any single non-zero input will un-mute. It is done per channel based. 0 – disable 1 – enable (default)
CLICKFREE	6	0 – disable digital click free power up and down 1 – enable digital click free power up and down (default)
VPPSCALE	5:4	Reserved
DACLRBOTH	3	1 – enable simultaneous load of DACLVOL and DACRVOL 0 – disable simultaneous load (default)
DACSOFTRAMP	2	1 – enable DAC soft ramp at mute and volume change (default) 0 – disable
DACRAMPRATE	1:0	These bits define DAC gain control ramp rate 00 – 0.5 dB per 4 LRCKs (default) 01 – 0.5 dB per 8 LRCKs 10 – 0.5 dB per 16 LRCKs 11 – 0.5 dB per 32 LRCKs

Register 16 – DAC Control 3, Default 0000 1000

Bit Name	Bit	Description
DACINVL	5	0 – DAC left channel output no phase inversion (default) 1 – DAC left channel output 180 degree phase inversion
DACINVR	4	0 – DAC right channel output no phase inversion (default) 1 – DAC right output 180 degree phase inversion
DACTOEN	3	Reserved
DACDAT	2	0 – disable DAC data 6 dB attenuate 1 – -6 dB enable

Register 17 – DAC Control 4, Default 0000 0000

Bit Name	Bit	Description
DACZEROL	5	0 – normal (default) 1 – set left channel DAC output all zero
DACZEROR	4	0 – normal (default) 1 – set right channel DAC output all zero
DACMONO	3	0 – stereo (default), and enable SE function 1 – mono ((L+R)/2) into DACL and DACR, and disable SE function
DACSE	2:0	Stereo enhancement gain 000 – 0 (default) 001 – 1/8 ... 111 – 7/8

Register 47 – Power Down Control, Default 0000 1100

Bit Name	Bit	Description
PDN_ANA	3	0 – not power down 1 – power down analog blocks (default)
PDN_DIG	2	0 – not power down 1 – power down digital blocks (default)
PDN_FSM	1	0 – not power down (default) 1 – power down FSM
PDN_DLL	0	0 – not power down (default) 1 – power down DLL

Register 48 – Reference 1, Default 0000 0000

Bit Name	Bit	Description
SEQ_EN	0	0 – internal power up/down sequence disable (default) 1 – internal power up/down sequence enable

Register 49 – Reference 2, Default 0010 1000

Bit Name	Bit	Description
ENREFR	5	0 – disable reference 1 – enable reference (default)
VROI	4	0 – 1.5kΩ VREF to analog output resistance (default) 1 – 40kΩ VREF to analog output resistance
VMIDSEL	3:2	00 – Vmid disabled (off mode) 01 – 50kΩ divider enabled (playback/record mode) 10 – 500kΩ divider enabled (standby mode, default) 11 – 5 kΩ divider enabled (fast start-up mode)
VMIDLOW	1:0	Reserved

Register 50 – Reference 3, Default 0011 0100

Bit Name	Bit	Description
PDN_VREFGEN	5	0 – not power down 1 – power down VREFGEN (default)
PDN_IBIASGEN	4	0 – not power down 1 – power down IBIASGEN (default)
LP_DACVRP	3	0 – normal (default) 1 – low power mode for DACVRP
LP_VREFBUF	2	0 – normal 1 – low power for VREFBUF (default)
PDN_VREFBUF	1	0 – not power down (default) 1 – power down VREFBUF
VREFR_LO	0	0 – normal (default) 1 – low power for VREFR

Register 51 – Reference 4, Default 1111 1100

Bit Name	Bit	Description
IBIASSW	7	Reserved

VSEL	6:0	Reserved
------	-----	----------

Register 52 – Reference 5, Default 0101 0101

Bit Name	Bit	Description
MOUT_REF2	7	Reserved
MOUT_REF1	6	Reserved
OUT3_REF2	5	Reserved
OUT3_REF1	4	Reserved
OUT2_REF2	3	Reserved
OUT2_REF1	2	Reserved
OUT1_REF2	1	Reserved
OUT1_REF1	0	Reserved

Register 53 – Reference 6, Default 0000 0101

Bit Name	Bit	Description
MONO_REF2	3	Reserved
MONO_REF1	2	Reserved
MIX_REF2	1	Reserved
MIX_REF1	0	Reserved

PLL SETTING
Register 54 – PLL Control 1, Default 0000 1000

Bit Name	Bit	Description
pdn	7	0 – not power down (default) 1 – power down PLL analog
cp2	6	Reserved
cp1	5	Reserved
cp0	4	Reserved
SupSel1	3	Reserved
SupSel0	2	Reserved
kvco1	1	Reserved
kvco0	0	Reserved

Register 55 – PLL Control 2, Default 0000 0000

Bit Name	Bit	Description
LP	4	0 – normal mode (default) 1 – low power mode for PLL analog
MCLKSEL	3	Select internal master clock 0 – from MCLK pin (default) 1 – from PLL (to use PLL, make sure PLEN=1, PLL_RB=1, otherwise, the setting will close chip clock)
PLLOUT_DIV2	2	0 – divide disabled, PLL out clock is vcoout/4 (default) 1 – divide enabled, PLL out clock is vcoout/8
PLL_RB	1	0 – PLL held in reset (default) 1 – PLL running (if PLEN=1)
PLL_EN	0	0 – PLL disabled (default) 1 – PLL enabled

Register 56 – PLL Control 3, Default 0000 0000

Bit Name	Bit	Description
DITH_MAG	6:4	Reserved
PLL_N	3:0	Integer part of PLL input/output frequency ratio; Use value greater than 5 and less than 13

Register 57 – PLL_K[21:16], Default 0000 0000

Bit Name	Bit	Description
PLL_K[21:16]	5:0	Fractional part of PLL input/output frequency ratio (treat as one 22-digital binary number)

Register 59 – PLL_K[15:8], Default 0000 0000

Bit Name	Bit	Description
PLL_K[15:8]	7:0	Fractional part of PLL input/output frequency ratio (treat as one 22-digital binary number)

Register 60 – PLL_K[7:0], Default 0000 0000

Bit Name	Bit	Description
PLL_K[7:0]	7:0	Fractional part of PLL input/output frequency ratio (treat as one 22-digital binary number)

DIGITAL AUDIO INTERFACE

The device provides four formats of serial audio data interface to the input of the DAC through LRCK, SCLK and SDIN pins. The four formats are I²S, left justified, right justified and DSP/PCM mode. DAC input DSDIN is sampled by PA5155 on the rising edge of DSCLK. The relationship of SDATA (SDIN), SCLK and LRCK with the three formats is shown through Figure 3 to Figure 7.
