

## One-of-Eight Decoder with Three-State Outputs and Polarity Control

## DISTINCTIVE CHARACTERISTICS

- Three-state decoder outputs
- Buffered common output polarity control
- Inverting and non-inverting enable inputs
- AC parameters specified over operating temperature and power supply ranges.

## GENERAL DESCRIPTION

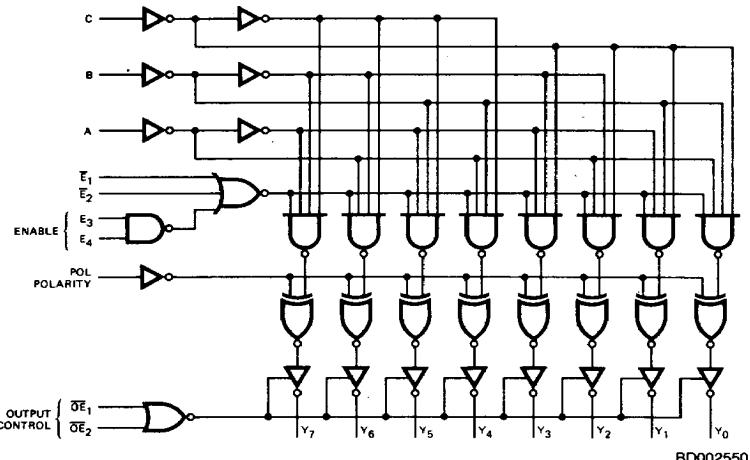

The Am2921 is a three-line to eight-line decoder/demultiplexer fabricated using advanced Low-Power Schottky technology. The decoder has three buffered select inputs A, B, and C, which are decoded to one-of-eight Y outputs. Two active-HIGH and two active-LOW enables can be used for gating the decoder or can be used with incoming data for demultiplexing applications.

A separate polarity (POL) input can be used to force the function active-HIGH or active-LOW at the output. Two

separate active-LOW output enables ( $\overline{OE}$ ) inputs are provided. If either  $\overline{OE}$  input is HIGH, the output is in the high impedance (off) state. When the POL input is LOW, the Y outputs are active-HIGH and when the POL input is HIGH, the Y outputs are active-LOW.

The device is packaged in a space saving (0.3-inch row spacing) 20-pin package.

## ORDERING INFORMATION

AMD products are available in several packages and operating ranges. The order number is formed by a combination of the following: Device number, speed option (if applicable), package type, operating range and screening option (if desired).

**Am2921****D C B**

Screening Option  
Blank – Standard processing  
B – Burn-in

Temperature (See Operating Range)  
C – Commercial (0°C to +70°C)  
M – Military (-55°C to +125°C)

Package  
D – 20-pin CERDIP  
F – 20-pin flatpak  
L – 20-pin leadless chip carrier  
P – 20-pin plastic DIP  
X – Dice

## PIN DESCRIPTION

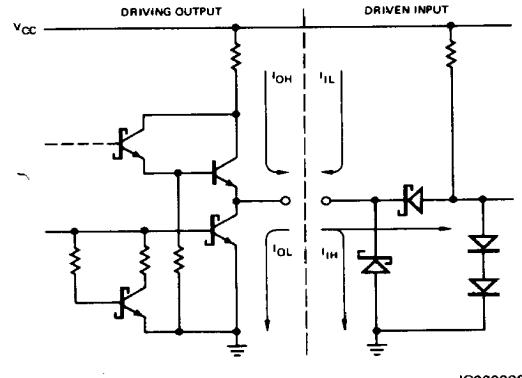

Pin No.	Name	I/O	Description
6, 7, 17	A, B, C	I	The three select inputs to the decoder/demultiplexer.
16, 15	$\bar{E}_1, \bar{E}_2$	I	The active LOW enable inputs. A HIGH on either the $\bar{E}_1$ or $\bar{E}_2$ input forces all decoded functions to be disabled.
14, 13	$E_3, E_4$	I	The active HIGH enable inputs. A LOW on either $E_3$ or $E_4$ inputs forces all the decoded functions to be inhibited.
12	POL	I	Polarity Control. A LOW on the polarity control input forces the output to the active-HIGH state while a HIGH on the polarity control input forces the Y outputs to the active-LOW state.
4, 5	$\bar{O}E_1, \bar{O}E_2$	I	Output Enable. When both the $\bar{O}E_1$ and $\bar{O}E_2$ inputs are LOW, the Y outputs are enabled. If either $\bar{O}E_1$ or $\bar{O}E_2$ input is HIGH, the Y outputs are in the high impedance state.
	$Y_i$	O	The eight outputs for the decoder/demultiplexer.
