

This series of fixed-voltage monolithic integrated-circuit voltage regulators designed for a wide range of applications. These applications include on-card regulation for elimination of noise and distribution problems associated with single-point regulation. Each of these regulators can deliver up to 500 mA of output current. The internal current limiting and tamper shutdown features of these regulators make them essentially immune to overload.

FEATURES

- Terminal Regulators.
- Output Current Up to 500mA.
- No External Components.
- Internal Thermal Overload Protection.
- High Power Dissipation Capability.
- Internal Short-Circuit Current Limiting.
- Output Transistor Safe-Area Compensation.

Standard Application

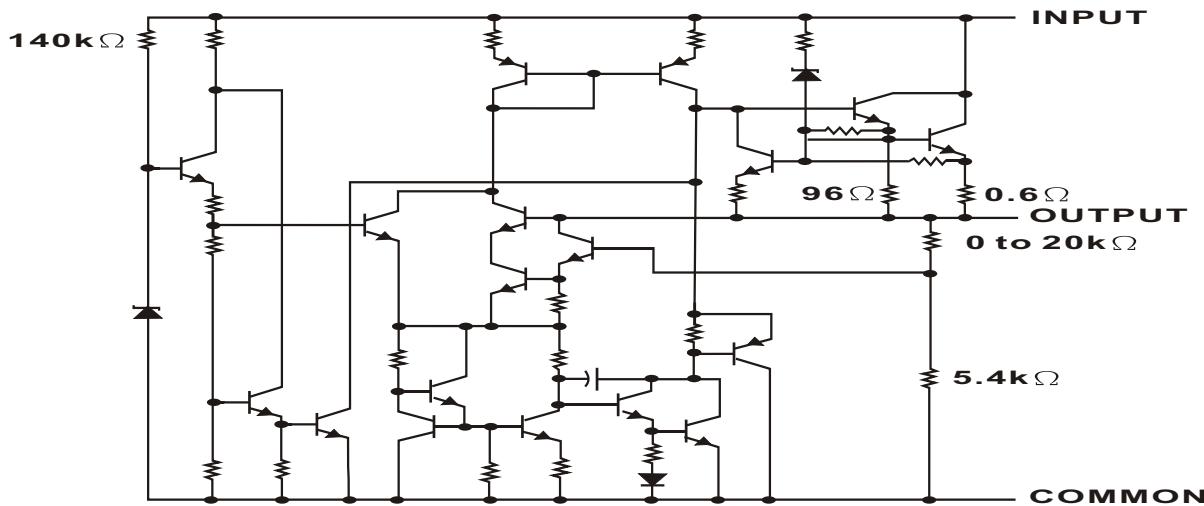

A common ground is required between the input and the output voltages. The input voltage must remain typically 2.0V above the output voltage even during the low point on the input ripple voltage.

* C_{in} is required if regulator is located in appreciable distance from power supply filter.

** C_O is not needed for stability; however, it does improve transient response.
