

## 64K x 4 Static RAM with Separate I/O

2

### Features

- High speed
  - 12 ns
- Transparent write (CY7C191)
- CMOS for optimum speed/power
- Low active power
  - 880 mW
- Low standby power
  - 220 mW
- TTL-compatible inputs and outputs
- Automatic power-down when deselected

### Functional Description

The CY7C191 and CY7C192 are high-performance CMOS static RAMs organized as 65,536 x 4 bits with separate I/O. Easy memory expansion is provided by active LOW chip enable (CE) and three-state drivers. They have an automatic power-down feature, reducing the power consumption by 75% when deselected.

Writing to the device is accomplished when the chip enable (CE) and write enable (WE) inputs are both LOW.

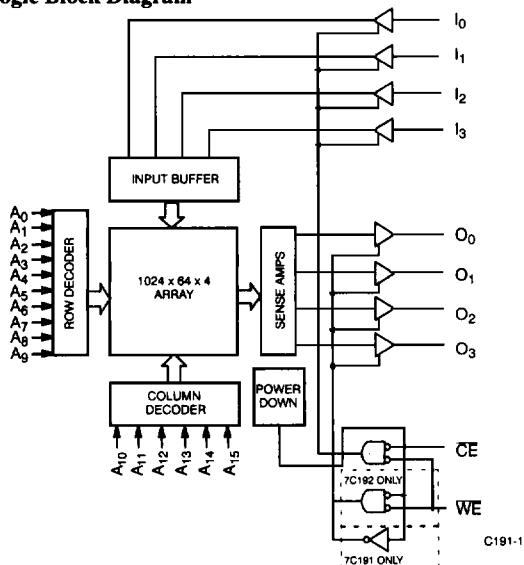

Data on the four input pins ( $I_0$  through  $I_3$ ) is written into the memory location specified on the address pins ( $A_0$  through  $A_{15}$ ).

Reading the device is accomplished by taking the chip enable (CE) LOW while the write enable (WE) remains HIGH. Under these conditions the contents of the memory location specified on the address pins will appear on the four data output pins.

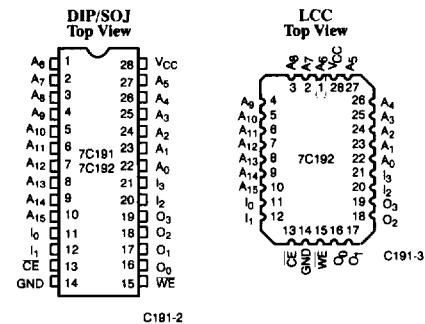

The output pins stay in high-impedance state when write enable (WE) is LOW (CY7C192 only), or chip enable (CE) is HIGH.

A die coat ensures alpha immunity.

CY7C191  
CY7C192

### Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature .....  $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

Ambient Temperature with

Power Applied .....  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

Supply Voltage to Ground Potential

(Pin 28 to Pin 14) .....  $-0.5\text{V}$  to  $+7.0\text{V}$

DC Voltage Applied to Outputs

in High Z State<sup>[1]</sup> .....  $-0.5\text{V}$  to  $\text{V}_{\text{CC}} + 0.5\text{V}$

DC Input Voltage<sup>[1]</sup> .....  $-0.5\text{V}$  to  $\text{V}_{\text{CC}} + 0.5\text{V}$

Output Current into Outputs (LOW) ..... 20 mA

Static Discharge Voltage ..... >2001V  
(per MIL-STD-883, Method 3015)

Latch-Up Current ..... >200 mA

### Operating Range

Range	Ambient Temperature	$\text{V}_{\text{CC}}$
Commercial	$0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	$5\text{V} \pm 10\%$
Military <sup>[2]</sup>	$-55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	$5\text{V} \pm 10\%$

			Mil				15	

Shaded area contains preliminary information.

#### Notes:

1. Minimum voltage is equal to  $-2.0\text{V}$  for pulse durations of less than 20 ns.
2.  $T_A$  is the "instant on" case temperature.

3. See the last page of this specification for Group A subgroup testing information.

4. Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.

Shaded area contains preliminary information.

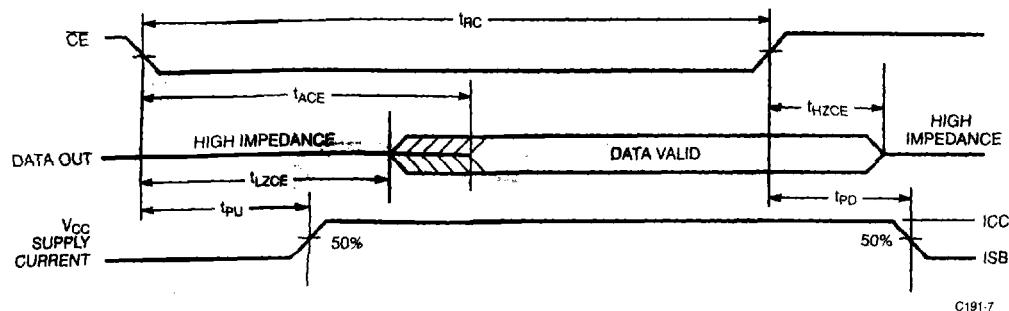

**Notes:**

- 7. Test conditions assume signal transition time of 3 ns or less for  $-12$  and  $-15$  speeds and 5 ns or less for  $-20$  through  $-45$  speeds, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified  $I_{OL}/I_{OH}$  and 30-pF load capacitance.
- 8. At any given temperature and voltage condition,  $t_{HZCE}$  is less than  $t_{LZCE}$ ,  $t_{HZWE}$  is less than  $t_{LZWE}$  for any given device. These parameters are guaranteed by design and not 100% tested.
- 9.  $t_{HZCE}$  and  $t_{HZWE}$  are specified with  $C_L = 5$  pF as in part (b) of AC Test Loads. Transition is measured  $\pm 500$  mV from steady-state voltage.
- 10. The internal write time of the memory is defined by the overlap of CE LOW and WE LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold times should be referenced to the rising edge of the signal that terminates the write.

2

C191-6

**Read Cycle No. 2<sup>[11, 13]</sup>**

C191-7

**Write Cycle No. 1 (WE Controlled)<sup>[10]</sup>**

C191-8

**Notes:**

11. WE is HIGH for read cycle.
12. Device is continuously selected,  $\overline{CE} = V_{IL}$ .
13. Address valid prior to or coincident with  $\overline{CE}$  transition LOW.

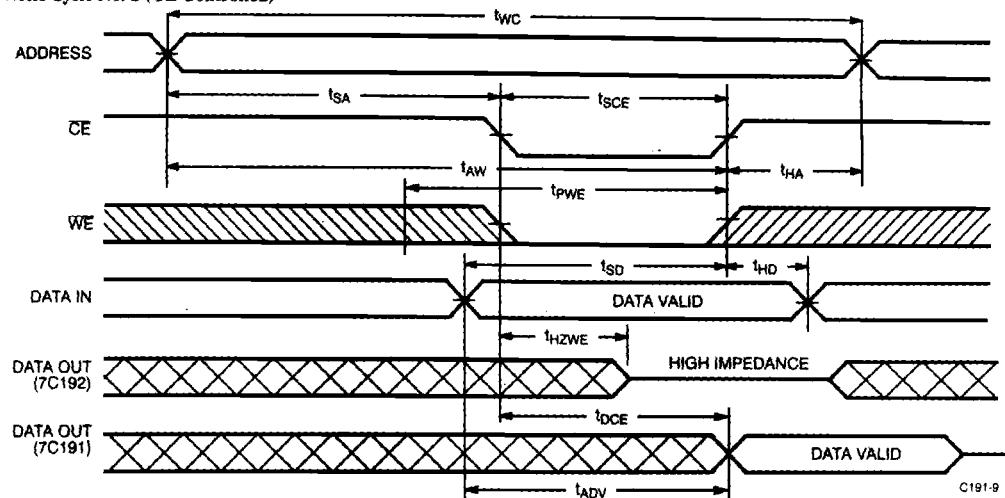

14. If  $\overline{CE}$  goes HIGH simultaneously with WE HIGH, the output remains in a high-impedance state (7C192 only).
