

HD66214T (Micro-TAB)

(80-Channel Column Driver in Micro-TCP)

Description

The HD66214T, the column driver for a large liquid crystal graphic display, features as many as 80 LCD outputs powered by 80 internal LCD drive circuits. This device latches 4-bit parallel data sent from an LCD controller, and generates LCD drive signals. In standby mode provided by its internal standby function, only one drive circuit operates, lowering power dissipation. The HD66214, packaged in an 8-mm-wide micro-tape carrier package (micro-TCP), enables a compact LCD system with a narrower frame (peripheral areas for LCD drivers) —about half as large as that of an existing system. The HD66214T is a low power dissipation device powered by 2.7–5.5 V suitable for battery-driven portable equipment such as notebook personal computers and palm-top personal computers.

Features

- Duty cycle: 1/64 to 1/240
- High voltage
 - LCD drive: 10–28 V
- High clock speed
 - 8 MHz max under 5-V operation (HD66214T)
 - 4 MHz max under 3-V operation (HD66214TL)
- Display off function
- Internal automatic chip enable signal generator
- Various LCD controller interfaces
 - LCTC series: HD63645, HD64645, HD64646
 - LVIC series: HD66840, HD66841
 - CLINE: HD66850
- 98-pin TCP

Ordering Information

Type No.	Voltage Range	Outer Lead Pitch 1	Outer Lead Pitch 2	Device Length
HD66214TA1	2.7–5.5 V	0.15 mm	0.80 mm	3 sprocket holes
HD66214TA2	2.7–5.5 V	0.18 mm	0.80 mm	3 sprocket holes
HD66214TA3	2.7–5.5 V	0.20 mm	0.80 mm	3 sprocket holes
HD66214TA6	2.7–5.5 V	0.20 mm	0.45 mm	3 sprocket holes
HD66214TA9L	2.7–5.5 V	0.22 mm	0.45 mm	2 sprocket holes

- Notes:
1. Outer lead pitch 1 is for LCD drive output pins, and outer lead pitch 2 for the other pins.
 2. Device length includes test pad areas.
 3. Spacing between two sprocket holes is 4.75 mm.
 4. Tape film is Upirex (a trademark of Ube Industries, Ltd.).
 5. 35-mm-wide tape is used.
 6. Leads are plated with Sn.
 7. The details of TCP pattern are shown in "The Information of TCP."

Pin Functions

Power Supply

V_{CC}, V_{EE}, GND: V_{CC}–GND supplies power to the internal logic circuits. V_{CC}–V_{EE} supplies power to the LCD drive circuits.

V1, V3, V4: Supply different levels of power to drive the LCD. V1 and V_{EE} are selected levels, and V3 and V4 are non-selected levels. See figure 1.

Control Signal

CL1: Inputs display data latch pulses for the line data latch circuit. The line data latch circuit latches display data input from the 4-bit latch circuit, and outputs LCD drive signals corresponding to the latched data, both at the falling edge of each CL1 pulse.

CL2: Inputs display data latch pulses for the 4-bit latch circuit. The 4-bit latch circuit latches display data input via D₀–D₃ at the falling edge of each CL2 pulse.

M: Changes LCD drive outputs to AC.

D₀–D₃: Input display data. High-voltage level of data corresponds to a selected level and turns an LCD pixel on, and low-voltage level data corresponds to a non-selected level and turns an LCD pixel off.

SHL: Shifts the destinations of display data output. See figure 2.

$\overline{E}$: A low $\overline{E}$ enables the chip, and a high $\overline{E}$ disables the chip.

$\overline{CAR}$: Outputs the $\overline{E}$ signal to the next HD66214 if HD66214s are connected in cascade.

$\overline{DISPOFF}$: A low $\overline{DISP}$ sets LCD drive outputs Y₁–Y₈₀ to V1 level.

LCD Drive Output

Y₁–Y₈₀: Each Y outputs one of the four voltage levels V1, V3, V4, or V_{EE}, depending on a combination of the M signal and display data levels. See figure 3.

Figure 3 Selection of LCD Drive Output Level

Block Functions

Controller: The controller generates the latch signal at the falling edge of each CL2 pulse for the 4-bit latch circuit.

4-Bit Latch Circuit

The 4-bit latch circuit latches 4-bit parallel data input via the D0 to D3 pins at the timing generated by the control circuit.

Line Data Latch Circuit

The 80-bit line data latch circuit latches data input from the 4-bit latch circuit, and outputs the latched data to the level shifter, both at the falling edge of each clock 1 (CL1) pulse.

Level Shifter

The level shifter changes 5-V signals into high-voltage signals for the LCD drive circuit.

LCD Drive Circuit

The 80-bit LCD drive circuit generates four voltage levels V1, V3, V4, and VEE, for driving an LCD panel. One of the four levels is output to the corresponding Y pin, depending on a combination of the M signal and the data in the line data latch circuit.

Pins: 1. CL1, CL2, M, SHL, E, D₀-D₃, DISPOFF

2. CAR

3. Y₁-Y₈₀, V1, V3, V4

4. V1, V3, V4

Notes: 1. Indicates the resistance between one pin from Y₁-Y₈₀ and another pin from V1, V3, V4, and V_{EE} , when load current is applied to the Y pin; defined under the following conditions.

$$V_{CC} - GND = 28 \text{ V}$$

$$V1, V3 = V_{CC} - \{2/10(V_{CC} - V_{EE})\}$$

$$V4 = V_{EE} + \{2/10(V_{CC} - V_{EE})\}$$

V1 and V3 should be near V_{CC} level, and V4 should be near V_{EE} level (figure 6). All voltage must be within ΔV . ΔV is the range within which R_{ON} , the LCD drive circuits' output impedance, is stable. Note that ΔV depends on power supply voltage $V_{CC} - V_{EE}$ (figure 7).

2. Input and output current is excluded. When a CMOS input is floating, excess current flows from the power supply through the input circuit. To avoid this, V_{IH} and V_{IL} must be held to V_{CC} and GND levels, respectively.

3. Applies to standby mode.
