

DRAM

2 MEG x 8

3.3V, BURST EDO

FEATURES

- Burst order, interleave or linear, programmed by executing WCBR cycle after initialization
- Single +3.3V $\pm 5\%$ power supply
- All inputs and outputs are LVTTTL-compatible with 5V input/output tolerance
- Industry-standard x8 pinout and packages
- High-performance CMOS silicon-gate process
- Refresh: CAS-BEFORE-RAS (CBR) or RAS ONLY
- 2,048-cycle refresh (11 row-, 10 column-addresses)
- Four-cycle Extended Data-Out (EDO) burst accesses

OPTIONS

- Timing
 - 52ns access; 15ns cycle -52
 - 60ns access; 16.6ns cycle -60
- Packages
 - Plastic SOJ (300 mil) DJ
- Refresh
 - Standard (2,048 cycles at 32ms) None
- Part Number Example: MT4LC2M8F4DJ-52

KEY TIMING PARAMETERS

SPEED	^t RAC	^t PC	^t CAC	^t COH	^t DS	^t DH
-52	52ns	15ns	10ns	3ns	0ns	5ns
-60	60ns	16.6ns	11ns	3ns	0ns	5ns

GENERAL DESCRIPTION

The MT4LC2M8F4 is a randomly accessed solid-state memory containing 16,777,216 bits organized in a x8 configuration. During READ or WRITE cycles, each bit is uniquely addressed through the 21 address bits, which are entered 11 bits (A0-A10) at RAS time and 10 bits (A0-A9) at CAS time.

The MT4LC2M8F4 is a burst access DRAM in which all READ and WRITE cycles occur in bursts of four. The bursts wrap around on a 4-byte boundary. This means only the two least significant bits of the CAS address are modified internally to produce each address of the burst sequence. The burst type, interleave or linear, is determined by executing a WCBR cycle with address A0 set to either HIGH or LOW. A0 LOW will program the device to execute linear

PIN ASSIGNMENT (Top View)

A2	12	17	A5
A3	13	16	A4
Vcc	14	15	Vss

bursts, A0 HIGH will program the bursts to be interleave. For future compatibility it is strongly recommended that the information (0010 000x) where x=A0 is supplied on addresses A7-A0 during the WCBR cycle. The WCBR cycle must be followed by a RAS-ONLY or CBR REFRESH cycle to exit this programming mode.

A READ or WRITE cycle is selected with the WE input during the first CAS LOW pulse of the burst. During the burst cycle the WE input must remain constant for the burst to continue. Transition of the WE input during a burst causes the burst to terminate and places the outputs in a High-Z state. After a terminated burst, the next falling edge of CAS will start a new burst access at the address present on the external address bus.

During a WRITE cycle, data-in (DI) is latched by the falling edge of CAS. WE must be LOW prior to CAS going LOW. This places the input/output pins in the High-Z state allowing the data-in (DI) to be driven on the bus. WE must remain LOW during the burst operation for the burst to complete. WE going HIGH after tWCH from CAS LOW and before tWCS of the next CAS LOW terminates the burst operation and places the DQ pins in the High-Z state.

GENERAL DESCRIPTION (continued)

During a READ cycle $\overline{WE}$ must be HIGH prior to $\overline{CAS}$ going LOW. $\overline{WE}$ must remain HIGH during the burst operation for the burst to complete. $\overline{WE}$ going LOW after 'RCH from $\overline{CAS}$ LOW and before 'RCS of the next $\overline{CAS}$ LOW terminates the burst operation and places the DQ pins in the High-Z state.

Returning $\overline{RAS}$ and $\overline{CAS}$ HIGH terminates burst operations in the selected row, resets the burst counter, closes that row and decreases chip current to a reduced standby level. The chip is precharged for the next access during the $\overline{RAS}$ HIGH time.

FUNCTIONAL BLOCK DIAGRAM Burst EDO

EDO BURST MODE TRUTH TABLE

PRESENT STATE	RESULTING STATE	$\overline{\text{RAS}}$	$\overline{\text{CAS}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	ADDRESSES		DATA

PROGRAM	EXIT PROGRAM MODE Using $\overline{\text{RAS}}$ -ONLY REFRESH	L	H	X	X	ROW	X	High-Z

NOTE: 1. A WCBR cycle determines the burst sequence. A0=LOW sets the burst sequence to linear, A0=HIGH set the burst sequence to interleave. A8 through A10 are "don't cares." A7-A0 should contain the sequence (0010 000x where x=A0) to ensure future compatability. A refresh cycle ($\overline{\text{RAS}}$ ONLY or CBR) must follow the WCBR cycle to exit the programming mode.

INTERLEAVE BURST SEQUENCE TABLE

OPERATION	ADDRESSES USED		
	A10 - A2	A1	A0
First access, register external CAS address	A10 - A2	A1	A0

OUTPUT LOAD EQUIVALENT

NOTES

1. All voltages referenced to Vss.
2. Input Power-up: $V_{IH} \leq +5.5V$ and $V_{CC} \leq +3.13V$ for $t \leq 200ms$
3. This parameter is sampled. $V_{CC} = 3.13V$ $f = 1$ MHz.
4. Address transitions once per burst access.
5. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum tPC and 50 percent duty cycle. The outputs are open.
6. Enables on-chip refresh and address counters.
7. Initialization consists of an initial pause of 100 μs after power-up followed by eight $\overline{RAS}$ refresh cycles ($\overline{RAS}$ -ONLY or CBR with $\overline{WE}$ HIGH). This sequence must be executed before proper device operation is assured. The eight $\overline{RAS}$ cycle wake-ups should be repeated any time the tREF refresh requirement is exceeded. A WCBR cycle must be executed to initialize the burst type, interleave or linear followed by a $\overline{RAS}$ -ONLY or CBR REFRESH cycle.
8. AC characteristics assume $^tT = 1.5ns$.
9. All output timings are referenced to 1.5V and all input timings are referenced to 1.5V, unless otherwise specified. Inputs must be driven to the appropriate voltage levels indicated by the corresponding timing diagrams when AC specifications are measured, as shown in Figure 1.
10. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
11. NC pins are assumed to be left floating and are not tested for leakage.
12. tAA is a calculated specification which is the sum of tPC and tCAC .
13. Output loading is specified with $C_L = 5pF$ as in Figure 2. These parameters are sampled.
14. Applies only during burst termination operation.
15. AC output loading is specified with $C_L = 50pF$ as in Figure 3. Figure 4 is shown for reference. Transition is measured at the 1.5V reference level.
16. The DQs will continue to drive data out until tBTHZ (MIN) and tWHZ (MIN) have both been satisfied and will reach the High-Z state once tBTHZ (MAX) and tWHZ (MAX) have both been satisfied.
17. Valid data-in is referenced from when a valid logic level (V_{IH} , V_{IL}) has been achieved.

BURST EDO READ CYCLE

NOTE:

1. Latch column address; start READ cycle.
2. Output data 1; increment burst counter.
3. Output data 2; increment burst counter.
4. Output data 3; increment burst counter.
5. Output data 4; latch column address; start READ cycle.
6. $\overline{WE}$ transitioning LOW will terminate the burst and reset the burst counter provided 1TP and 1BTH are satisfied. The DQs will continue to drive data out until 1BTHZ (MIN) and 1WHZ (MIN) have both been satisfied and will reach the High-Z state once 1BTHZ (MAX) and 1WHZ (MAX) have both been satisfied.
7. Once $\overline{OE}$ transitions LOW after $\overline{CAS}$ transitions LOW, Note 9 applies if $\overline{OE}$ transitions back HIGH.
8. The combination of $\overline{RAS}$ and $\overline{CAS}$ HIGH close the row and place the DQs in the High-Z state. 1OFF is measured from the last signal ($\overline{RAS}$ or $\overline{CAS}$) that transitions HIGH.
9. When $\overline{OE}$ transitions HIGH, the DQ pins are placed in the High-Z state and will remain in the High-Z state until another $\overline{CAS}$ LOW transition occurs, regardless of the state of $\overline{OE}$.
10. $\overline{WE}$ transitioning LOW and returning HIGH prior to $\overline{CAS}$ going HIGH will not terminate the burst.

WCBR PROGRAM CYCLE

- NOTE:**
1. A0 LOW sets the burst sequence to linear bursts. A0 HIGH sets the burst sequence to interleave bursts. Addresses A8 through A10 are "don't cares." Addresses A7-A1 should contain the state of (0010 000x where x=A0) to ensure future compatibility. The burst sequence will remain set until the device power is interrupted or another WCBR cycle is executed.
 2. A $\overline{\text{RAS}}$ -ONLY or CBR REFRESH cycle must be executed after the WCBR cycle to exit the programming mode.
