

High-Speed Drivers with SPDT JFET Switches

Features

- Constant On-Resistance Over Entire Analog Range
- Low Leakage
- Low Crosstalk
- Rad Hardness

Benefits

- Low Distortion
- Eliminates Large Signal Errors
- High Precision
- High Bandwidth Capability
- Fault Protection

Applications

- Audio Switching
- Video Switching
- Sample/Hold
- Guidance and Control Systems
- Telemetry

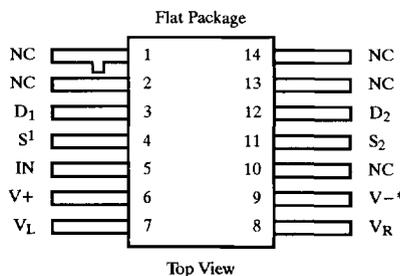

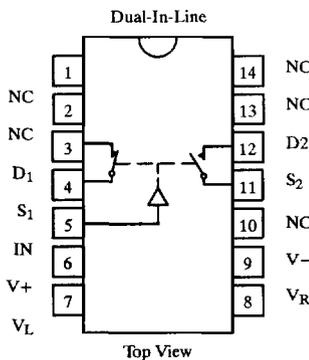

Description

The DG186/187/188 are precision single-pole, double-throw (SPDT) analog switches designed to provide accurate switching of video and audio signals. This series is ideally suited for applications requiring a constant on-resistance over the entire analog range.

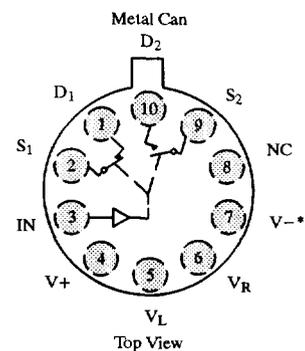

The major difference in the devices is the on-resistance (DG186—10 Ω , DG187—30 Ω , DG188—75 Ω). Reduced errors are achieved through low leakage current ($I_{D(on)}$ < 2 nA). Applications which benefit from the flat JFET on-resistance include audio switching, video switching, and data acquisition.

To achieve fast and accurate switch performance, each device comprises two n-channel JFET transistors and a TTL compatible bipolar driver. The driver is designed to achieve break-before-make switching action, eliminating the inadvertent shorting between channels and the crosstalk which would result. In the on state, each switch conducts current equally well in either direction. In the off condition, the switches will block up to 20 V peak-to-peak, with feedthrough of less than -60 dB at 10 MHz.

Notes:

- Refer to PROCESS OPTION FLOWCHART (Section 5 of the 1994 Data Book or FaxBack number 7103).
- Room = 25°C, Full = as determined by the operating temperature suffix.
- Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.
- The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.
- Guaranteed by design, not subject to production test.
- V_{IN} = input voltage to perform proper function.

Typical Characteristics

Typical Characteristics (Cont'd)

Schematic Diagram (Typical Channel)

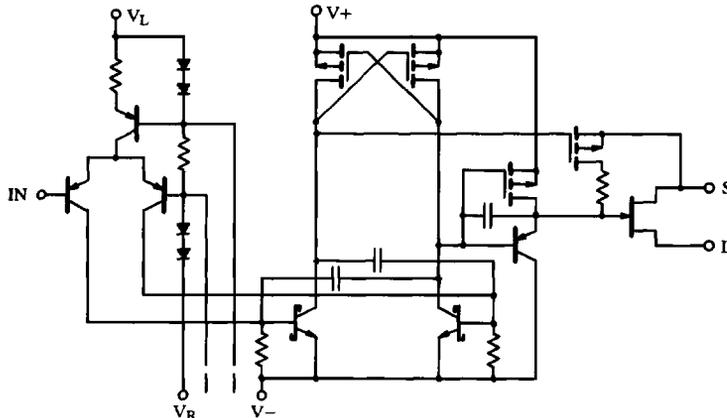

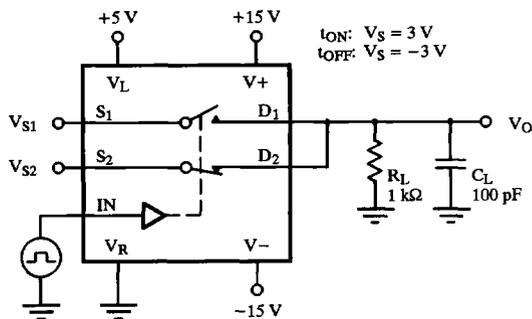

Figure 1.

Test Circuits

Feedthrough due to charge injection may result in spikes at the leading and trailing edge of the output waveform.

C_L (includes fixture and stray capacitance)

$$V_{OUT} = V_S \times \frac{R_L}{R_L + \tau_{DS(on)}}$$

$t_{ON}: V_S = 3\text{ V}$
 $t_{OFF}: V_S = -3\text{ V}$
