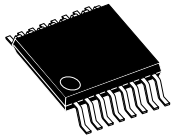
STLVDS3487

High speed differential line drivers

Feature summary

- Meets or exceeds the requirements of ansi TIA/EIA-644 standard
- Low voltage differential signaling with typical output voltage of 350mV and a 100Ω load
- Typical output voltage rise and fall times of 750ps (400Mbps)
- Typical propagation delay times of 1.7ns
- Operates from a single 3.3V supply
- Power dissipation 25mW typical per driver at 200MHz
- Driver at high impedance when disabled or with V_{CC} = 0V
- Pin compatible with the MC3487 and SN65LVD3487
- Low voltage TTL (LVTTL) logic input levels



TSSOP

Description

The STLVDS3487 is a quad differential line drivers that implements the electrical characteristics of low voltage differential signaling (LVDS). This signaling technique lowers the output voltage levels of 5V differential standard levels (such as TIA/EIA-422B) to reduce the power, increase the switching speeds and allows operations with a 3.3V supply rail. Any of the four current mode drivers will deliver a minimum differential output voltage magnitude of 247mV into a 100Ω load when enabled.

The intended application of this device and signalling technique is for point-to-point baseband data transmission over controlled impedance media approximately 100Ω. The transmission media may be printed circuit board traces, backplanes or cables. The ultimate rate and distance of data transfer is dependent upon the attenuation characteristics of the media and noise coupling to the environment.

The STLVDS3487 is characterized for operation from -40°C to 85°C.

7 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
