### Description

The VS-705 is a Voltage Controlled SAW Oscillator that operates at the fundamental frequency of the internal SAW filter. The SAW filter is a high-Q Quartz device that enables the circuit to achieve low phase jitter performance over a wide operating temperature range. A divider circuit is deployed for output frequencies less than 491.52 MHz. The oscillator is housed in a hermetically sealed leadless surface mount package and offered on tape and reel. It has a tri-state Output Select function that provides one of three conditions: Output Disable, Output Set, or Output Enable.

## Absolute Maximum Ratings

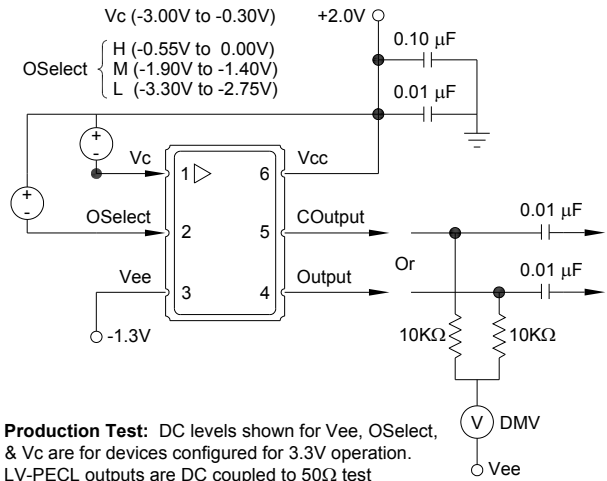

Parameter	Symbol	Ratings	Unit
Power Supply	$V_{CC}$	0 to 6	V
Input Current	$I_{IN}$	100	mA
Output Current	$I_{OUT}$	25	mA
Voltage Control Range	$V_C$	0 to $V_{CC}$	V
Output Select	OSelect	0 to $V_{CC}$	V
Storage Temperature	$T_{STR}$	-55 to 125	°C
Soldering Temperature / Duration	$T_{PEAK} / t_P$	260 / 40	°C / sec

Stresses in excess of the absolute maximum ratings can permanently damage the device. Also, exposure to these absolute maximum ratings for extended periods may adversely affect device reliability. Functional operation is not implied at these or any other conditions in excess of those represented in the operational sections of this datasheet. Permanent damage is also possible if any device input ( $V_C$  or OS) draws >100 mA.

## Test Circuits & Output Load Configurations

**Functional Test:** Allows use of standard power supply biasing configuration. Pull down resistors are used for LV-PECL outputs and are removed for with LVDS outputs. Since the LVDS outputs are AC coupled, the output DC levels cannot be measured.

**Production Test:** DC levels shown for Vee, OSelect, &  $V_C$  are for devices configured for 3.3V operation. LV-PECL outputs are DC coupled to 50Ω test equipment. LVDS outputs are connected to a digital voltmeter, then AC coupled to the test equipment. The digital voltmeter allows for Mid Level & Swing measurements.

**LV-PECL to LV-PECL:** For short transmission lengths, the pull down resistor values shown provide reasonable power consumption and waveform performance.

**LVDS to LVDS:** The 100Ω resistor should be removed if this load is provided internally within the LVDS receiver.

## Reliability

VI qualification includes aging at various extreme temperatures, shock and vibration, temperature cycling, and IR reflow simulation. The VS-705 family is capable of meeting the following qualification tests:

## Environmental Compliance

Parameter	Conditions
Mechanical Shock	MIL-STD-883, Method 2002
Mechanical Vibration	MIL-STD-883, Method 2007
Solderability	MIL-STD-883, Method 2003
Gross and Fine Leak	MIL-STD-883, Method 1014
Resistance to Solvents	MIL-STD-883, Method 2016
Moisture Sensitivity Level	IPC/JEDEC J-STD-020, MSL1

## Handling Precautions

Although ESD protection circuitry has been designed into the VS-705 proper precautions should be taken when handling and mounting. VI employs a human body model (HBM) and a charged-device model (CDM) for ESD susceptibility testing and design protection evaluation.

## ESD Ratings

Model	Minimum	Conditions
Human Body Model	2000 V	MIL-STD 883, Method 3015
Charged Device Model	1000 V	JEDEC, JESD22-C101
Machine Model	200 V	JEDEC, JESD22-A115-A

## Reflow Profile (IPC/JEDEC J-STD-020)

Parameter	Symbol	Value
PreHeat Time	$t_s$	60 sec Min, 180 sec Max
Ramp Up	$R_{UP}$	3 °C/sec Max
Time Above 217 °C	$t_L$	60 sec Min, 150 sec Max
Time To Peak Temperature	$t_{AMB-P}$	480 sec Max
Time At 260 °C	$t_P$	20 sec Min, 40 sec Max
Ramp Down	$R_{DN}$	6 °C/sec Max

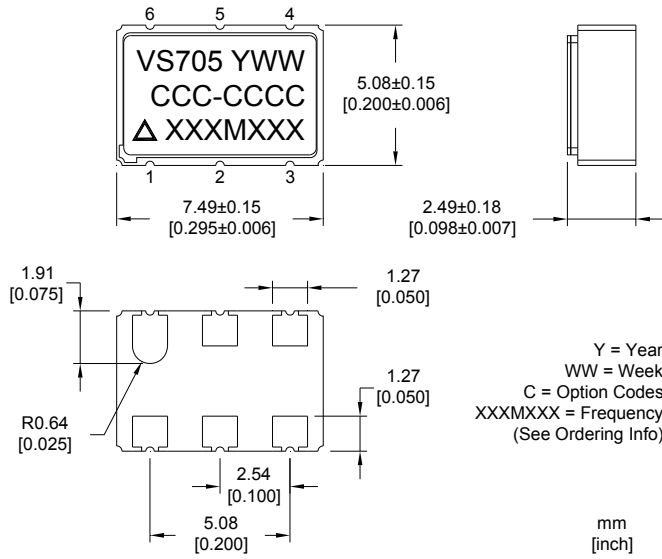

The device has been qualified to meet the JEDEC standard for Pb-Free assembly. The temperatures and time intervals listed are based on the Pb-Free small body requirements. The temperatures refer to the topside of the package, measured on the package body surface. The VS-705 device is hermetically sealed so an aqueous wash is not an issue.

Terminal Plating: Electroless Ni > 1.90  $\mu\text{m}$   
Electroless Au > 1.50  $\mu\text{m}$
