

# YMU757

## MA-1

---

### ■ Outline

The YMU757 is a high quality melody LSI for cellular phone handsets, supporting the data format for various applications including ringing and holding melody sounds. The built-in Yamaha's original FM synthesizer can create various timbres, and its built-in sequencer can produce up to 4 different sounds with 4 different timbres simultaneously without placing a load to the controller.

The serial port controller interface enables real time reproduction of the melody data via FIFO, without the limitation of the data capacity.

With a built-in amplifier to drive the dynamic type speaker, it is possible to connect the speaker directly.

This LSI also has an analog-output terminal for the phone jack. In the stand-by mode, the power consumption can be reduced to 1  $\mu$ A or less while waiting.

A portable terminal machine.

### ■ Features

- YAMAHA's original FM sound generator function
- Built-in sequencer
- Capable of producing up to 4 different sounds simultaneously (4 independent timbres available)
- Built-in output 400mW speaker amplifier
- Built-in circuit for sound quality correcting equalizer
- Built-in serial interface
- 2.688, 8.4, 12.6, 14.4, 19.2, 19.68, 19.8 and 27.82 MHz serial clock inputs support
- Analog output for ear phone.
- Power down mode (Typ 1  $\mu$ A or less)
- Power supply voltage (Digital and Analog) : 3.0V  $\pm$  10 %
- 20-pin TSSOP

## General description of YMU757

The YMU757 is controlled by way of the serial interface.

Shown below is its internal configuration.

When the data is inputted into the serial interface, it is converted into the parallel data and transmitted to each function block according to the index address.

The musical score data is stored in the 32-word FIFO first and then transmitted to the sequencer where it is interpreted and signals to control sound generation of the FM synthesizer is output.

The timbre register is where up to 8 timbre data can be stored.

Also, as the sequencer controlling parameters, the start/stop and tempo signals are provided.

In order to have sound generated, the following processes must be performed for this LSI.

- 1) Initial status setting (cancellation of power-down function, clock selection, etc.)
- 2) Timbre data setting
- 3) Writing the musical score data in FIFO before starting the sequence
- 4) Writing the next musical score data before FIFO becomes empty upon receipt of the interrupt signal from FIFO during reproduction.

(For the details, refer to "Settings & procedure required to generate melody".)

## ■ Block description

### 1) Serial interface

When the serial interface receives the serial data, it identifies the index data and transmits the control data to each function block.

### 2) FIFO

The musical score data are stored temporarily in FIFO which can contain up to 32 musical score data. The musical score data are processed in the sequencer when they are generated as sounds and those that have been processed are deleted one after another. When the remaining data amount in FIFO reaches the register setting (IRQ point) or less, it outputs an interrupt signal to ask for the continuing musical score data to be fed.

### 3) Sequencer

When the sequencer receives the START command, it starts to read the musical score data which have been stored in FIFO. The processed musical score data are deleted.

### 4) Timbre register

The timbre data are stored in this register which can contain up to 8 timbres. Settings for this register must be made before sound generation. It is initialized when the hardware or the software is reset but the values are retained while in the power-down mode and also after it is cancelled.

### 5) FM synthesizer

The timbres are synthesized and generated according to settings. Four sounds can be generated at the same time.

### 6) D/A, volume and amplifier

The outputs from the synthesizer are D/A converted and volume processed. After that, they are output from the speaker or the earphone output terminal.

Note : Ish = Schmitt input terminal AI = Analog input terminal AO = Analog output terminal

## ■ Block diagram

Concerning AIN signal inputted into equalizer circuit

As this design presupposes the use of this LSI for the "hands-free", it is possible to process the FM sound and call sound by analog mixing in the equalizer circuit and output the resulting sound through the speaker.

| \$F0 - FFh   | ForLSITEST (access prohibited) |     |     |     |     |     |     |     |      |     |      |           |     |        |      |      | LSI TEST                             |

Note : Making an access to the spaces marked "Reserved" and "ForLSITEST" in the above table is prohibited.

Be sure to write "0" for the empty bit, although writing "1" there will not affect the LSI operation.

## Explanation of registers

The YM U 757 has three types of control registers. They are musical score data, timbre data and other control data.

### ☐ Musical score data

#### \$00h Musical score data

The musical score data are written in FIFO whose capacity is 32 words. There are two types of musical score data; note data and rest data.

Note data Default: 0000h

#### BL1 – BL0 : Octave block setting

Three octave blocks are available for sound range setting. The setting range is 1 to 3. Do not use "0" for setting.

The sound generation range involves the coefficient named "Multiple" (multiplying factor for sound frequency).

By combining the octave block and Multiple settings, sounds can be generated in the ranges as listed in the table below.

Since the setting ranges of "Multiple" coefficient is 0 to 7, actually, sounds can be generated in a wider ranges than those given in the table below.

|               | Multiple = 1 (x1)                                                                                                                                                         | Multiple = 2 (x2)                                                                                                                                                          | Multiple = 4 (x4)                                                                                                                                                                     |

## NT3 - NT0 : Pitch setting

Four bits from NT3 to 0 are used to specify the pitch. The bit assignment is as shown below.

| NT[3:0] | Pitch         |
|---------|---------------|
| 0h      | not pronounce |
| 1h      | C#            |
| 2h      | D             |
| 3h      | D#            |
| 4h      | Inhibit       |
| 5h      | E             |
| 6h      | F             |
| 7h      | F#            |
| 8h      | Inhibit       |
| 9h      | G             |
| Ah      | G#            |
| Bh      | A             |
| Ch      | Inhibit       |
| Dh      | A#            |
| Eh      | B             |
| Fh      | C             |

If "0h" is set to NT[3:0], movement of LSI is as follows.

- The problem that LSI hangs up doesn't occur.
- The part specified with CH[1:0] isn't pronounced in spite of the establishment value of pronunciation head TK[2:0] to explain in the rest.
- The interval time when it is set with TI[3:0] to explain in the rest is effective.  
When interval time passes, it deals with the next music data.
- Though it looks like a "rest", there is a difference in behavior with the following case as a movement.

Envelope wave shape of carrier

The treatment of the next music data begins at the time of A.  
When rest data were specified, as for the release time is goes on.  
When the data NT is "0h" in the same part, a release of the slant line part is not pronounced.

## CH1 - CH0 : Part setting

As the sound generator can generate sounds in 4 parts simultaneously, set the part for each note by using CH1 and 0 bits.

| CH [1:0] | Part |
|----------|------|
| 00b      | 0    |
| 01b      | 1    |
| 10b      | 2    |
| 11b      | 3    |

## VIB : Vibrato setting

This bit is used to set Vibrato function on or off for each note : "0" to set it off and "1" to set it on.

The vibrato frequency is 6.4Hz and the modulation rate is  $\pm 13.47$  cent.

When VIB bit of timbre data (\$10-2Fh) is "0", Vibrato function off.

## TI3 - TI0 : Interval setting

These bits are used to set the interval period before the note and rest are processed next. The interval "48" represents the time for the whole note.

| TI [3:0] | Interval |
|----------|----------|
| 0h       | 0        |
| 1h       | 2        |
| 2h       | 3        |
| 3h       | 4        |
| 4h       | 6        |
| 5h       | 8        |
| 6h       | 9        |
| 7h       | 12       |
| 8h       | 18       |
| 9h       | 24       |
| Ah       | 48       |
| Bh       | 0        |
| Ch       | 16       |
| Dh       | 24       |
| Eh       | 36       |
| Fh       | 48       |

## TK2 - 0 : Note (sound length) designation

These 3 bits are used to designate the note (sound length). Depending on the values of interval setting (TI3 - 0), the length varies as shown in the following table. The interval "48" represents the time for the whole note.

| TK[2:0]      | TI [3:0] = 0-Ah |   |   |   |   |   |    |    | TI [3:0] = B-Fh |    |    |    |    |    |    |           |
|--------------|-----------------|---|---|---|---|---|----|----|-----------------|----|----|----|----|----|----|-----------|
|              | 0               | 1 | 2 | 3 | 4 | 5 | 6  | 7  | 0               | 1  | 2  | 3  | 4  | 5  | 6  | 7         |
| Sound length | 1               | 2 | 3 | 5 | 7 | 8 | 11 | 17 | 15              | 23 | 29 | 32 | 35 | 41 | 47 | Tie, Slur |

When KEY is turned on again under the condition that a release isn't finished completely, a tone may change. (It is limited when envelope wave shape is sustained sound.) This happens because envelope wave shape of the carrier side of FM sound source and modulator side are shifted.

As for the condition that it stops completely, it moves to attack rate at the same time with KEY ON. If the last pronunciation is condition that in release and isn't stopped completely, the establishment of a release is made forcibly early (8.94 ms). And it moves to attack rate from the condition that it stops. (A in figure)

It thinks that there is a tone which only release time is different from with the carrier and modulator. Though envelope of the solid line changes to attack rate soon at the time of the second KEY ON. But can't move to attack rate soon, because sound doesn't stop completely, envelope of the dotted line. It moves to attack rate after he speed up release time and it becomes the condition that release time is stops completely.

Both envelope are shifted by this movement.

And the symptom that a tone changes in the period when it is surrounded by a circle occurs.

- It is pronounced under the condition that a release stops completely.
- The release time of the tone is shortened with the carrier, modulator side as well.

-The release time of career side and modulator side is made the same length.

| Index | b15 | b14 | B13 | b12 | b11 | b10 | b9  | b8  | b7   | b6  | b5  | b4  | b3  | b2   | b1   | b0   |

| \$00h | 0   | 0   | 1   | 1   | 0   | 0   | CH1 | CH0 | VCHE | TI3 | TI2 | TI1 | TI0 | VCH2 | VCH1 | VCH0 |

## CH1 - CH0 : Part setting

Using CH1 or 0 bit, set the part for each rest.

| CH[1:0] | Part |
|---------|------|
| 00b     | 0    |
| 01b     | 1    |
| 10b     | 2    |
| 11b     | 3    |

## TI3 - TI0 : Interval setting

These bits are used to set the interval before the note and rest are processed next.

The interval "48" represents the time for the whole note.

| TI [3:0] | Interval |
|----------|----------|
| 0h       | 3        |
| 1h       | 2        |
| 2h       | 3        |
| 3h       | 4        |
| 4h       | 6        |
| 5h       | 8        |
| 6h       | 9        |
| 7h       | 12       |
| 8h       | 18       |
| 9h       | 24       |
| Ah       | 48       |
| Bh       | 1        |
| Ch       | 16       |
| Dh       | 24       |
| Eh       | 36       |
| Fh       | 48       |

## VCHE, VCH2 - 0 : Timbre change function

Although the maximum number of timbres that can be used simultaneously is four, the timbre can be changed during sound reproduction by setting these bits. Set "1" for VCHE and use VCH2 to VCH0 to set the timbre No.. Then starting with the note whose sound is to be generated next, the timbre for the part which has been set by using CH0 and 1 will be changed.

Change a tone after the pronunciation of a part to change stops completely.

The condition that pronunciation stops is not the condition that TK (pronunciation length) is finished, but the condition that the time when releases of envelope is finished.

Be careful because strange sound momentarily is pronounced when you change a tone under the condition that pronunciation doesn't stop completely.

If the timbre allotment is changed by using this function, the \$30h register itself will be rewritten.

## □ Timbre data

### \$10 – 2Fh Timbre data

It is possible to register the data for 8 timbres in the register and 4 among them can be reproduced simultaneously.

One timbre consists of [parameter for the modulator] and [parameter for the carrier] as a set.

(For the details of the modulator and the carrier, please refer to "General description of FM sound generator").

Index 10h, 11h ... Timbre data for the 1st timbre modulator

Index 12h, 13h ... Timbre data for the 1st timbre carrier

Index 14h, 15h ... Timbre data for the 2nd modulator

Index 16h, 17h ... Timbre data for the 2nd timbre carrier

... .. Omitted... ..

Index 2Ch, 2Dh ... Timbre data for the 8th timbre modulator

Index 2Eh, 2Fh ... Timbre data for the 8th timbre carrier

The following bit assignment is used for both modulator and carrier.

The setting must be completed before any sound is generated. It is prohibited to change the timbre parameter while any sound is generated.

Timbre data Default: 0000h

| Index | B15 | b14 | b13 | b12 | B11 | b10 | B9  | b8  | b7  | b6  | b5  | b4  | b3  | b2  | b1  | b0  |

| ODD   | AR1 | AR0 | SL3 | SL2 | SL1 | SL0 | TL5 | TL4 | TL3 | TL2 | TL1 | TL0 | WAV | FL2 | FL1 | FL0 |

ML2 - ML0 : Multiple setting

"Multiple" refers to the multiplying factor for sound frequency. The output frequency is determined by the octave, pitch and multiple settings on the carrier side. On the modulator side, it is possible to adjust the multiple setting and create different timbres.

| ML [2:0] | Multiplying factor for frequency |
|----------|----------------------------------|
| 0h       | x 1/2                            |
| 1h       | x 1                              |
| 2h       | x 2                              |
| 3h       | x 3                              |
| 4h       | x 4                              |
| 5h       | x 5                              |
| 6h       | x 6                              |
| 7h       | x 7                              |

## VIB : Vibrato

This function is used for setting the vibrato function on or off. Use "0" to set it off and "1" to set it on.

The vibrato frequency is 6.4Hz and the modulation rate is  $\pm 13.47$ cent.

## EGT : Envelope waveform type

This function is used to select the type of the envelope waveform.

Use "0" for the damped sound and "1" for the sustained sound.

Shown below are the waveforms for the damped sound and sustained sound.

## AR3 - AR0 : Attack rate setting

"Attack rate" refers to the time from start of the sound generation (-48dB) until it reaches the maximum volume (0dB).

The table on page 15 shows the settings by the time required to reach 0dB from -48dB.

## DR3 - DR0 : Decay rate setting

The decay rate refers to the damping time required to reach the sustain level (SL) from the maximum volume level (0dB). The table below shows the settings by the time required to reach -48dB from 0dB.

## RR3 - RR0 : Release rate setting

The release rate is defined differently for the damped sound and the sustained sound.

- In the case of the damped sound, it means the damping time from the sustain level to the end of the sound length.

The sound is damped in 286ms (time to reach -48dB from 0dB) after the end of the sound length is reached.

- In the case of the sustained sound, it means the damping time from the end of the sound length.

## SL3 - SL0 : Sustain level setting

The sustain level refers to the level at which shifting from the decay rate to the release rate takes place in the case of the damped sound, and the volume level of the sound being sustained in the case of the sustained sound.

| SL ->             | SL3 | SL2 | SL1 | SL0 |

| 2h                            | 19040.84                            | 36617.00                                            |
| 1h                            | 38081.68                            | 73234.00                                            |
| 0h                            | Inhibit                             | Infinity                                            |

## TL5 - TL0 : Total level setting

This function is used to set the envelope level.

| TL                | TL5 | TL4 | TL3 | TL2 | TL1  | TL0   |
|-------------------|-----|-----|-----|-----|------|-------|
| Weighted bit (dB) | -24 | -12 | -6  | -3  | -1.5 | -0.75 |

## SUS : Sustain on/off setting

"0" : OFF

"1" : ON The release rate changes to "6" (2.29s) when the sound length comes to the end.

## WAV : Waveform selection

The modulator and carrier can generate the SIN wave but when this bit setting is made, it is possible to generate a half-wave rectified waveform of the SIN wave, the timbres in wider range can be created.

"0" : SIN wave

"1" : Half-wave rectified waveform of the SIN wave.

## FL2 - FL0 : Feed-back setting

This function is effective for the operator on the carrier side only. It is used to set the feedback modulation rate.

Be sure to set "0" for the operator on the modulator side. This is effective when generating the strings.

|                 |   |           |          |          |          |         |          |          |

| Modulation rate | 0 | $\div 16$ | $\div 8$ | $\div 4$ | $\div 2$ | $\cdot$ | $2\cdot$ | $4\cdot$ |

## ☐ Other control data

### \$30h Timbre allotment data

One melody consists of four parts and a timbre is allotted for each of these parts. Among the eight timbres registered in the timbre data register, use four of them for each of these parts.

Default: 0000h

| Index | b15 | b14 | b13 | b12 | b11 | b10 | b9  | b8  | b7 | b6  | b5  | b4  | b3 | b2  | b1  | b0  |
|-------|-----|-----|-----|-----|-----|-----|-----|-----|----|-----|-----|-----|----|-----|-----|-----|
| \$30h | 0   | V32 | V31 | V30 | 0   | V22 | V21 | V20 | 0  | V12 | V11 | V10 | 0  | V02 | V01 | V00 |

"x" in Vx[2:0] means the part No.

The timbre data used with Vx[2:0] are as follows.

| Vx[2:0] | Timbre data to be used                  |
|---------|-----------------------------------------|
| 0h      | Timbre set for index 10 to 13h is used. |
| 1h      | Timbre set for index 14 to 17h is used. |
| 2h      | Timbre set for index 18 to 1Bh is used. |
| 3h      | Timbre set for index 1C to 1Fh is used. |
| 4h      | Timbre set for index 20 to 23h is used. |
| 5h      | Timbre set for index 24 to 27h is used. |
| 6h      | Timbre set for index 28 to 2Bh is used. |
| 7h      | Timbre set for index 2C to 2Fh is used. |

### \$31h Tempo data

The "tempo" refers to the number of quarter notes reproduced in one minute. Use this setting to set the tempo of the melody used when reproduced. The setting data is (8739/TEMPO)-1

Default: 0000h

| Index | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|-------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| \$31h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | T7 | T6 | T5 | T4 | T3 | T2 | T1 | T0 |

### \$32h FM section control

Default: 0000h

| Index | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1  | b0 |
|-------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|-----|----|
| \$32h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | CLR | ST |

ST : This bit is used to control start/stop of the melody. Use "1" for the start setting and "0" for the stop setting.

CLR : This bit is used to initialize the entire LSI by the software. Bit CLR itself is not cleared when it is set as "1".

Bit CLR should be written "0".

### \$33h Clock selection

Default: 0000h

| Index | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2     | b1 | b0 |
|-------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|--------|----|----|
| \$33h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | 0  | 0  | CLKSEL |    |    |

This setting sets the clock frequency inputted through the CLK\_I terminal.  
Be sure to execute this setting before reproducing the melody.  
Even if clock of which frequency is being inputted during resetting, it is OK.

| CKSEL [2:0] | Clock frequency (MHz) |
|-------------|-----------------------|
| 0h          | 2.688                 |
| 1h          | 19.200                |
| 2h          | 19.680                |
| 3h          | 19.800                |
| 4h          | 8.400                 |
| 5h          | 14.400                |
| 6h          | 27.821                |
| 7h          | 12.600                |

## **\$34h Interrupt control**

Default: 0000h

| Index | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5   | b4        | b3 | b2 | b1 | b0 |
|-------|-----|-----|-----|-----|-----|-----|----|----|----|----|------|-----------|----|----|----|----|
| \$34h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | IRQE | IRQ point |    |    |    |    |

The musical score data is taken into FIFO which has a capacity for 32 data. As the sounds are reproduced, the data in FIFO are processed and deleted. When the amount of data remaining in FIFO becomes less than the IRQ point set value, an interrupt signal is generated. At this point, set "0" for IRQE and write the continuing musical score data into FIFO. Make sure that the written data exceeds the IRQ point. After writing the data, reset "1" for IRQE and wait until another interrupt signal is generated.

IRQ point can set 32 ways from 0 (empty) to 31 (1 data vacancy).

IRQE is enable bit. Set "1" for enable.

## **\$35h Speaker volume control**

## **\$36h FM volume control**

## **\$37h Ear phone output volume control**

Default: 0000h

| Index   | b15 | b14 | b13 | b12 | b11 | b10 | b9 | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
|---------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| \$35-7h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | V4 | V3 | V2 | V1 | V0 |

These bits are used to set the volume of each source. The volume setting consists of 31 steps and mute function. It is possible to set at 1dB intervals. As the default is muted, cancel the mute function before proceeding to sound generation. Also, to reduce the power, be sure to mute the volume subject to power reduction before shifting.

Relations of register setting value and volume.

| V[4:0] | Volume(dB) | V[4:0] | Volume(dB) | V[4:0] | Volume(dB) | V[4:0] | Volume(dB) |
|--------|------------|--------|------------|--------|------------|--------|------------|
| 00h    | MUTE       | 08h    | -23        | 10h    | -15        | 18h    | -7         |
| 01h    | -30        | 09h    | -22        | 11h    | -14        | 19h    | -6         |
| 02h    | -29        | 0Ah    | -21        | 12h    | -13        | 1Ah    | -5         |
| 03h    | -28        | 0Bh    | -20        | 13h    | -12        | 1Bh    | -4         |
| 04h    | -27        | 0Ch    | -19        | 14h    | -11        | 1Ch    | -3         |
| 05h    | -26        | 0Dh    | -18        | 15h    | -10        | 1Dh    | -2         |
| 06h    | -25        | 0Eh    | -17        | 16h    | -9         | 1Eh    | -1         |
| 07h    | -24        | 0Fh    | -16        | 17h    | -8         | 1Fh    | 0          |

## \$38h Power Management control

Default: 001Eh

| Index | b15 | b14 | b13 | b12 | b11 | B10 | b9 | b8 | b7 | b6 | b5 | b4  | b3  | b2  | b1  | b0 |
|-------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|-----|-----|-----|-----|----|
| \$38h | 0   | 0   | 0   | 0   | 0   | 0   | 0  | 0  | 0  | 0  | 0  | AP4 | AP3 | AP2 | AP1 | DP |

This setting is used to reduce the power of each function. It is possible to control 1 digital system and 4 analog systems independently. (For the details, please refer to "Power-down control division diagram".)

Setting all bits to "1" will minimize the power of the entire LSI.

DP : Use of "1" for this setting will reduce the power of the entire digital section.

AP1 : Use of "1" for this setting will reduce the power of the VREF circuit in the analog section.

AP2 : Use of "1" for this setting will reduce the power on the non-inverted amplifier side of the FM volume, speaker volume, equalizer circuit and speaker output section.

AP3 : Use of "1" for this setting will reduce the power of the inverted amplifier side of the speaker output section.

AP4 : Use of "1" for this setting will reduce the power of the DAC and ear phone output volume.

After initialization, the power of the analog section (AP1 to AP4) is reduced.

## Power-down control division diagram

As for the power-down, it is possible to divide an inside function separately and to control it.

The power-down is controlled by Index 38h.

## Explanation of each bit

### DP

It is the bit to make the power-down whole of the digital department.

Because clock to move inside stops consumption electric current of the digital part can be restrained in minimum.

Data on FIFO are cleared though contents of a register are held.

### AP1

It is the bit that the power-down a VREF circuit decline.

If AP1 is set to "1", the whole of the analog part stops. Because an analog center voltage is made by VREF circuit.

### AP2

It is the bit to make power-down FM volume part, EQ circuit, speaker volume, and non-reversal amplifier side of speaker output part.

## AP3

It is the bit that the power-down the reversal amplifier side of the speaker output part decline.  
A reversal amplifier side is started after a VREF circuit and a non-reversal amplifier are started.  
And, it depends, and pop noise occurrence can be restrained.

## AP4

It is the bit that power-down DAC and the HP Volume part.

The attention point when the power-down moves.

Move from the condition that pronunciation surely stops for the power-down.

It is possible that the power-down a digital and an analog decline at the same time.

Be sure to mute FM Volume and HP Volume.

It is to restrain the noise when power going down.

The register which a digital part can't access during the power going down is as the following.

| Index    | Register functions |
|----------|--------------------|
| \$00h    | Note data          |
| \$10-2Fh | Tone data          |
| \$30h    | Timbre allotment   |
| \$31h    | Tempo data         |
| \$34h    | IRQ Control        |

The attention point to cancel the power-down

1 The time of  $64 \times CLK\_I$  is necessary before a digital part reverts to the normality after it is set up in DP=0.

Be sure to do register access after you wait for this time.

2 The following are procedure that revert from the condition in analog whole power-down and analog power supply off.

- AP1 is set to 0. VREF stands up at the time of maximum 50ms.

Until VREF stands up, don't set "0" to AP2-AP4.

- AP2 is set to 0.

- AP3, AP4 are set to 0 after minimum 10μs.

- An analog part becomes possible it moves.

AP4 is set to 1 when used only a speaker amplifier part (hands free phone).

AP2,3 are set to 1 when a speaker amplifier isn't used and only head phone is used.

And it is possible that electric current is further restrained.

Analog power supply OFF mode

Only while pronunciation stops, it is possible that an analog power supply is turned off.

Turn off an analog power supply after AP1, AP2, AP3 and AP4 are set to 1.

It has the possibility that pop noise occurs if it doesn't do so.

The establishment example by the use case.

Depending on how the function is used, bit settings can be combined as shown below.

|                                          | AP1 | AP2 | AP3 | AP4 | Precaution                                                                           |
|------------------------------------------|-----|-----|-----|-----|--------------------------------------------------------------------------------------|
| Power reduction of entire analog section | 1   | 1   | 1   | 1   | Be sure to set all volumes to "MUTE" first, then set all bits to "1" simultaneously. |
| Used for ear phone output only           | 0   | 1   | 1   | 0   | Set the FM and speaker volumes to "MUTE".                                            |
| Used for speaker only (hand-free phone)  | 0   | 0   | 0   | 1   | Set the HP and FM volumes to "MUTE".                                                 |

## ■ Resetting

This LSI can be initialized by setting the  $\overline{RST}$  terminal to "L" or through the software as the CLR bit is provided for the \$32h setting.

When initialization is executed,

- all the registers will be reset to the default state.
- the FIFO data counter will be cleared and FIFO will be empty.

It is necessary to input CLK\_I during resetting. Make sure to input CLK\_I for at least 100 clocks during resetting.

After resetting is cancelled, wait for at least 64 clocks of CLK\_I input and then start making an access to registers.

## ■ Settings and procedure to generate melody

Follow the steps as described below /

1. Set the CLK SEL (\$33h) according to the clock frequency inputted for CLK\_I.
2. Cancel the power-down mode of the analog section. (Refer to "Resetting sequence of analog section" on page 21.)
3. Set the timbre data (\$10-2Fh), timbre allotment data (\$30h), tempo data (\$31h) and volumes (\$35-37h) as desired.
4. Enter 32 musical score data (\$00h) until FIFO is full.
5. Set the IRQ point value of \$34h. (Default at the center of FIFO).
6. Set "1" for IRQ E of \$34h.
7. Set "1" for the ST bit of \$32h and start the melody.

## ■ Interrupt sequence

An interrupt from LSI ( $\overline{IRQ}$  -"L") occurs when the data amount in FIFO is less than the set value.

For example, supposing that 10h (16b) is set for the IRQ point of \$34h, FIFO is full with the data before starting the melody as described above under "Settings and procedure to generate melody".

Once the melody is started, the musical score data is processed and the data in FIFO reduces continuously. When the remaining data amount becomes 16 bytes or less, the  $\overline{IRQ}$  terminal becomes "L" and an interrupt signal is transmitted to the external microprocessor.

When an interrupt signal is detected, set "0" for IRQ E and enter the musical score data into FIFO before it becomes empty. As overwriting the data into the filled FIFO is prohibited, enter the data into FIFO by the amount not causing overwriting (16 data in this case).

## Flow chart

## State transition description

Shown below is a state transition diagram of the YMU757.

Sequence to turn on the power supply.

Ideally, the digital side power supply should be turned on first to initialize the hardware, followed by turning on of the analog side power supply. If the analog power supply is turned on when the hardware has not been initialized, noises may be generated.

Explains about each status

## Digital Power ON Ready

It is the condition before starting a digital power supply.

## Hardware Reset

The digital power supply has been turned on. Immediately after it has turned on, always enter the hardware resetting data.

## Analog Power ON Ready

It is the condition before starting an analog power supply. Turn on the analog power supply after the digital section has been initialized.

## Analog Power Down mode

It is the state that the consumption electric power of the analog part is minimum.

After the analog power supply has been turned on, the entire analog section is in the power down state. In order to proceed to the next step Initialized state, use the procedure described on page 20. The power of the analog section has been reduced. The power consumption of the analog section can be reduced.

Be sure to take the procedure to reduce the power of the analog section from the initialized state. (That is, each volume must be set to "MUTE".)

It is possible to select the point where the power is reduced depending on the use purpose. For the details, refer to "Power-down sequence" on pages 20 and 21.

To turn off the analog power supply, always take the necessary procedure from this state.

## Initialized

Becomes this state when it comes out of the power down mode of the analog part, the digital part.

And, move to the power down mode from this state.

## STOP

The volume muting function has been cancelled and the timbre data settings have been completed. In this state, FIFO is empty. This state is restored when the melody reproduction is stopped.

Also, the procedure to reduce the power of the digital section can be taken from this state. This state will be restored when the power-down function is cancelled.

## PLAY Standby

Writing the musical score data into FIFO has been completed and ready for melody reproduction. Setting "1" for the ST bit will set for the next PLAY mode. It is possible to take the procedure to reduce the power of the digital section from this state. However, the STOP state will be restored after the power-down function is cancelled.

## PLAY

The melody is being reproduced. Setting "0" for the ST bit will set to the STOP mode. It is prohibited to change the digital section from this mode to the power down mode. (It may cause noises to occur.)

## Digital Power Down mode

The power of the digital section has been reduced. ("1" set for DP bit)

As clocks are not inputted inside of the LSI even when they are inputted to the CLK\_I terminal, power consumption of the digital section can be reduced. Before proceeding to this mode, set both HP volume and FM volume to "MUTE".

## ■ Operation in FIFO empty state

If FIFO has become empty during reproduction, the musical score data written last is processed continuously until the next data is entered.

If the last written data is a note data, that note is reproduced continuously.

If the last written data is a rest data, the rest state will be maintained.

## ■ Reproduction method assuming occurrence of empty state

In the ordinary melody reproduction, it is prohibited to allow the FIFO empty state to occur. However, utilizing the above feature enables short sounds produced easily. The interrupt function would not be necessary.

To have short sounds produced, follow the steps as described below.

Short sounds are applicable to 1 to 32 word data block.

If the data block exceeds 33 words, use the regular reproduction procedure utilizing the interrupt function.

- 1) Complete the procedure of Power ON --> Analog Power Down mode -- Initialized --> STOP in advance. (Please refer to "State transition description" diagram on page 25.)
- 2) Start reproduction in the FIFO empty state.
- 3) Write the data block to be reproduced into FIFO.
- 4) Immediately after writing (after 0 to 20us), the musical score data are processed internally and reproduction is started.  
As reproduction goes on, the data in FIFO are processed and cleared.
- 5) When FIFO becomes empty, if the last data in the data block is a note data, that note is reproduced continuously and if it is a rest data, the rest state is retained until the next data block is written into FIFO.
- 6) When reproducing the next data block, go to step 3).  
To stop reproduction, set "0" for ST. Then the data counter of FIFO will be cleared and the state as described in step 1) will be restored.

## Example of system connection

## ■ One sound and volume level adjustment in 4 sound pronunciation

The volume level outputted from DAC by the number of the pronunciation is different.

When 1 sound (\*) is outputted from FM sound source, output voltage amplitude from DAC is 0.375V p-p.

When more than one sound is pronounced at the same time, output voltage amplitude varies in the phase of each wave shape.

But, when the wave shape of the same phase piles up, it becomes 0.75V p-p by 2 sound, 1.125V p-p by 3 sound, 1.5V p-p by 4 sound.

(\*: The volume adjustment (Total Level of Carrier) of 1 sound is being explained with the premise of 0dB.)

An assumption in 300m W output.

Output power from the speaker is 300m W when  $R_L$  is  $8\Omega$  and a voltage between SP OUT1 and 2 is 1.55V rms.

BTL output amplitude at this time becomes  $1.55 \times 2 \times 1.414 = 4.38V$  pp, and becomes  $4.38/3.8 = 1.15V$  pp with the EQ3 terminal.

(Gain with the speaker amplifier is +11.6dB = 3.8 times.)

Securing a volume level by one sound.

Gain adjustment in the part EQ amplifier is recommended as the way of securing a volume level by one sound.

Gain depends on the resistance ratio of  $R_1$  and  $R_2$ , and it is  $GAIN = R_2/R_1$ .

Gain to recommend is about four times from three times.

## A level adjustment recommendation example in all

FM volume or either of SP Volumes is a little squeezed as a default (from -3dB to -6dB).

When a user adjusts volume, it is considered controlling either FM or SP volume.

At this time, because the side which gain is raised to is secured in advance, either of FM volume or SP Volumes is a little squeezed as a default.

It is recommended making gain of the part EQ amplifier about 3 - 4 times to secure the output level for which to be one sound (For example,  $R1=22k\Omega$ ,  $R2=82k\Omega$ ).

When one sound is pronounced under this condition (FM volume as 0dB), EQ1 is 0.375V p-p.

In this state, if set gain=four times in EQ amplifier, EQ3 becomes 1.5V p-p.

When it is set up in -4dB with SPVOL, voltage between SPOUT1 and 2 becomes 3.6V p-p, and can be get output power 162mW with the speaker ( $RL=8\Omega$ ).

## A level adjustment of four sound pronunciation simultaneously

When usual music is regenerated, the amplitude of DAC never almost swings to 1.5V p-p.

Therefore, there is no hindrance by the setup of GAIN which is the same as 1 sound.

Adjust it with FM, SP Volume if you restrain GAIN of the part EQ amplifier a little when you are anxious about the distortion of the sound.

## A level adjustment of HPOUT

Adjust it outside the LSI when you raise gain on the HPOUT side.

## ■ Sound quality correction circuit

It is possible to correct the sound quality and gain by using an external circuit connected to EQ1 to 3 terminals. A circuit structure of EQ1 to 3 terminals and example of external circuit are as follows.

Gain and filter characteristic are adjusted by value of C1, C2, R1 and R2.

Gain =  $R2 / R1$ . Recommendation of R1 is 22k $\Omega$  and R2 is 82k $\Omega$  (gain = 3.7 times).

Cut off frequency f1 and f2 of filter is as follows.

$$f1 = 1 / (2\pi \times R1 \times C1).$$

$$f2 = 1 / (2\pi \times R2 \times C2).$$

Recommendation of each value are as follows.

If C1=0.022 $\mu$ F and C2=120pF, cut off frequency f1=330Hz and f2=16kHz.

Moreover, the circuit enclosed with the dotted line becomes necessary when an analog signal is inputted from AIN and it wants to mix it.

The level adjustment that it is mixed depends on the resistance ratio  $R2/Rx$  of Rx and R2.

The value of Rx when it wants to mix it in the amplitude of one time of AIN is 82k $\Omega$ .

If add resister R3, frequency characteristic is as follows.

$$\text{Gain1} = (R2 + R3) / R1. \text{Gain2} = R3 / R1.$$

Cutoff frequency f1 and f2 of filter is as follows.

$$f1 = 1 / (2\pi \times R1 \times C1).$$

$$f2 = 1 / (2\pi \times R2 \times C2).$$

## Serial I/F Specifications

The YM U757 is controlled through the three serial interfaces SCLK, SYNC and SD IN.

### About the relations between SD IN and SCLK

The value of SD IN is taken in the inside of the LSI at the SCLK rise.

Input SD IN so that setup/hold time is secured to rise edge of SCLK.

(Refer to the AC characteristics of the electric characteristics for the details of the timing specification.)

### About SD IN

The figure above shows no data transmission between Index data and Control data but it means nothing problematic. 24 bit continuous data transmission is also possible.

When transmitting the data by 8-bit unit, transmit the upper 8 bits and lower 8 bits of the control data separately.

There is no particular specification for the interval between the end of transmission of the upper 8 bits and start of transmission of the lower 8 bits. However, the longer the interval is, the longer time one transmission takes. When entering the musical score data into FIFO, use care not to make FIFO empty.

### About SYNC

It can correspond to Type1 and Type2 of the upper figure.

When rise edge of SYNC occurs inside the LSI, it considers that the data transfer of one time was completed.

SD IN for  $24 \times \text{SCLK}$  just before rise edge of SYNC occurs is judged valid data.

(SD IN for  $16 \times \text{SCLK}$  are valid data when transfer only Control data.)

There is no regulation specially about the length of the H period.

But, L period is to make 100ns be secured at least in the case of the Type2 wave shape

It has the possibility that faulty operation is caused when rise edge of SYNC and fall edge of SCLK approach it.

Give careful consideration to rise edge of SCLK doesn't occur toward rise edge of SYNC.

### About the data transfer only Control data.

If input SD IN for  $\text{SCLK} \times 16$  between rise edge of SYNC and next rise edge of SYNC, the inside of the LSI is judged it is music data (\$00h) and take it.

## ■ Electrical characteristics

### 1. Absolute maximum ratings

| Parameter                      | Symbol    | Min. | Max.          | Unit |
|--------------------------------|-----------|------|---------------|------|
| Power supply voltage (analog)  | $AV_{DD}$ | -0.3 | 4.2           | V    |
| Power supply voltage (digital) | $DV_{DD}$ | -0.3 | 4.2           | V    |
| Analog input voltage           | $V_{INA}$ | -0.3 | $AV_{DD}+0.3$ | V    |
| Digital input voltage          | $V_{IND}$ | -0.3 | $DV_{DD}+0.3$ | V    |
| Operating temperature          | $T_{OP}$  | -20  | 85            | °C   |
| Storage temperature            | $T_{STG}$ | -50  | 125           | °C   |

Note)  $DV_{SS} = AV_{SS} = SPV_{SS} = 0V$

### 2. Recommended operating conditions

| Parameter                   | Symbol    | Min. | Typ. | Max. | Unit |
|-----------------------------|-----------|------|------|------|------|
| Operating voltage (analog)  | $AV_{DD}$ | 2.7  | 3.0  | 3.3  | V    |
| Operating voltage (digital) | $DV_{DD}$ | 2.7  | 3.0  | 3.3  | V    |

\* When it was made to pronounce FM 4 sound at the same time in the same phase.

## ■ General description of FM sound generator

"FM" stands for Frequency Modulation.

The FM sound generator utilizes the higher harmonic wave produced by the frequency modulation for synthesis of the musical sounds.

As use of this FM system enables a comparatively simple circuit to produce such waveform that has a harmonic wave including disharmonious sounds, it is possible to create a wide range of sounds from the synthesized sounds of the natural musical instruments to the electronic sounds.

The diagram below shows the most basic configuration of the FM system.

The "Operator" refers to the section where a sine wave is generated and the combination of the operators is called "algorithm". The operator in the front stage is called "modulator" and that in the rear stage "carrier".

Each operator is capable of setting the frequency and the envelope waveform.

The configuration in the above diagram can be expressed in the formula as follows.

$$FM(t) = A \sin(\omega_c t + B \sin \omega_m t)$$

$A$  : Amplitude of the carrier.  $B$  : Amplitude of the modulator.  $\omega$  : Angular frequency of the carrier

$\omega_m$  : Angular frequency of the modulator

In addition, a system called "feedback FM" is available to create a wider range of sounds. In this system, the frequency modulation is fed back as shown in the diagram in the following page.

$B$  is called "feedback ratio". Using the feedback FM function, it is possible to produce the strings type sounds.

## External dimensions

端子厚さ :  $0.17 \pm 0.10$  or  $0.14 \pm 0.10$   
(LEAD THICKNESS)

カッコ内の寸法値は参考値とする。
