## EPROM/ROM-Based 8-Bit Microcontroller Series

## Devices Included in this Data Sheet:

- CP8056P : EPROM devices
- CP8056P : Mask ROM devices

## FEATURES

- Only 42 single word instructions
- All instructions are single cycle except for program branches which are two-cycle
- 13-bit wide instructions
- All ROM/EPROM area GOTO instruction
- All ROM/EPROM area subroutine CALL instruction
- 8-bit wide data path
- 5-level deep hardware stack
- Operating speed: DC-20 MHz clock input

DC-100 ns instruction cycle

| Device | Pins \# | I/O \# | EPROM/ROM (Byte) | RAM (Byte) |
| :---: | :---: | :---: | :---: | :---: |
| CP8056 | 18 | 12 | 1 K | 49 |

- Direct, indirect addressing modes for data accessing
- 8-bit real time clock/counter (TimerO) with 8-bit programmable prescaler
- Internal Power-on Reset (POR)
- Built-in Low Voltage Detector (LVD) for Brown-out Reset (BOR)
- Power-up Reset Timer (PWRT) and Oscillator Start-up Timer(OST)
- On chip Watchdog Timer (WDT) with internal oscillator for reliable operation and soft-ware watch-dog enable/disable control
- Two I/O ports IOA and IOB with independent direction control
- Soft-ware I/O pull-high/pull-down or open-drain control
- One internal interrupt source: Timer0 overflow; Two external interrupt source: INT pin, Port B input change
- Wake-up from SLEEP by INT pin or Port B input change
- Power saving SLEEP mode
- Programmable Code Protection
- Selectable oscillator options:
- RC: Resistor/Capacitor Oscillator
- XT: Crystal/Resonator Oscillator
- HF: High Frequency Crystal/Resonator Oscillator
- LF: Low Frequency Crystal Oscillator
- Wide-operating voltage range:
- EPROM : 2.3 V to 5.5 V
- ROM : 2.3 V to 5.5 V

## CHENGPIN

CP8056

## GENERAL DESCRIPTION

The CP8056 series is a family of low-cost, high speed, high noise immunity, EPROM/ROM-based 8-bit CMOS microcontrollers. It employs a RISC architecture with only 42 instructions. All instructions are single cycle except for program branches which take two cycles. The easy to use and easy to remember instruction set reduces development time significantly.
The CP8056 series consists of Power-on Reset (POR), Brown-out Reset (BOR), Power-up Reset Timer (PWRT), Oscillator Start-up Timer(OST), Watchdog Timer, EPROM/ROM, SRAM, tri-state I/O port, I/O pull-high/open-drain/pull-down control, Power saving SLEEP mode, real time programmable clock/counter, Interrupt, Wake-up from SLEEP mode, and Code Protection for EPROM products. There are four oscillator configurations to choose from, including the power-saving LP (Low Power) oscillator and cost saving RC oscillator. The CP8056 address $1 \mathrm{~K} \times 13$ of program memory.
The CP8056 can directly or indirectly address its register files and data memory. All special function registers including the program counter are mapped in the data memory.

PIN DESCRIPTIONS

| Name | I/O | Description |
| :---: | :---: | :--- |
| IOAO $\sim$ IOA3 | I/O | IOA0 ~ IOA3 as bi-direction I/O port |
| IOB0/INT | I/O | Bi-direction I/O pin with system wake-up function / External interrupt input |
| IOB1 ~ IOB7 | I/O | Bi-direction I/O port with system wake-up function |
| TOCKI | I | Clock input to Timer0. Must be tied to Vss or Vdd, if not in use, to reduce current <br> consumption |
| RSTB | I | System clear (RESET) input. This pin is an active low RESET to the device. |
| OSCI | I | X'tal type: Oscillator crystal input <br> RC type: Clock input of RC oscillator |
| OSCO | O | X'tal type: Oscillator crystal output. <br> RC mode: Outputs with the instruction cycle rate |
| Vdd | - | Positive supply |
| Vss | - | Ground |

Legend: I=input, O=output, I/O=input/output

### 1.0 MEMORY ORGANIZATION

CP8056 memory is organized into program memory and data memory.

### 1.1 Program Memory Organization

The CP8056 have a 10 -bit Program Counter capable of addressing a $1 \mathrm{~K} \times 13$ program memory space.
The RESET vector for the CP8056 is at 3FFh.
The H/W interrupt vector is at 008h. And the S/W interrupt vector is at 002h. CP8056 supports all ROM/EPROM area CALL/GOTO instructions without page.

FIGURE 1.1: Program Memory Map and STACK

### 1.2 Data Memory Organization

Data memory is composed of Special Function Registers and General Purpose Registers.
The General Purpose Registers are accessed either directly or indirectly through the FSR register.
The Special Function Registers are registers used by the CPU and peripheral functions to control the operation of the device.

TABLE 1.1: Registers File Map for CP8056 Series

| Address | Description |

Note 1 : There are 2 bits in CP8056.

### 2.0 FUNCTIONAL DESCRIPTIONS

### 2.1 Operational Registers

### 2.1.1 INDF (Indirect Addressing Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 00h (r/w) | INDF | Uses contents of FSR to address data memory (not a physical register) |  |  |  |  |  |  |  |

The INDF Register is not a physical register. Any instruction accessing the INDF register can actually access the register pointed by FSR Register. Reading the INDF register itself indirectly (FSR="0") will read 00h. Writing to the INDF register indirectly results in a no-operation (although status bits may be affected). The bits 5-0 of FSR register are used to select up to 64 registers (address: 00h ~ 3Fh).

## EXAMPLE 2.1: INDIRECT ADDRESSING

- Register file 38 contains the value 10 h
- Register file 39 contains the value 0Ah
- Load the value 38 into the FSR Register
- A read of the INDF Register will return the value of 10 h
- Increment the value of the FSR Register by one (@FSR=39h)
- A read of the INDR register now will return the value of OAh.

CP8056

### 2.1.2 TMR0 (Time Clock/Counter register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01h (r/w) | TMR0 | 8-bit real-time clock/counter |  |  |  |  |  |  |  |

The Timer0 is a 8-bit timer/counter. The clock source of Timer0 can come from the instruction cycle clock or by an external clock source (TOCKI pin) defined by TOCS bit (OPTION $<5>$ ). If TOCKI pin is selected, the Timer0 is increased by TOCKI signal rising/falling edge (selected by TOSE bit (OPTION<4>)).
The prescaler is assigned to Timer0 by clearing the PSA bit (OPTION $<3>$ ). In this case, the prescaler will be cleared when TMRO register is written with a value.

### 2.1.3 PCL (Low Bytes of Program Counter) \& Stack

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 02h (r/w) | PCL | Low order 8 bits of PC |  |  |  |  |  |  |  |

CP8056 devices have 10-bit wide Program Counter (PC) and five-level deep 10-bit hardware push/pop stack. The low byte of PC is called the PCL register. This register is readable and writable. The high byte of PC is called the PCH register. This register contains the $\mathrm{PC}<9: 8>$ bits and is not directly readable or writable. All updates to the PCH register go through the PCHBUF register. As a program instruction is executed, the Program Counter will contain the address of the next program instruction to be executed. The PC value is increased by one, every instruction cycle, unless an instruction changes the PC.
For a GOTO instruction, the $\mathrm{PC}<9: 0>$ is provided by the GOTO instruction word. The PCL register is mapped to $\mathrm{PC}<7: 0>$, and the PCHBUF register is not updated.
For a CALL instruction, the PC<9:0> is provided by the CALL instruction word. The next PC will be loaded (PUSHed) onto the top of STACK. The PCL register is mapped to PC<7:0> , and the PCHBUF register is not updated.
For a RETIA, RETFIE, or RETURN instruction, the PC are updated (POPed) from the top of STACK. The PCL register is mapped to $P C<7: 0>$, and the $P C H B U F$ register is not updated.
For any instruction where the PCL is the destination, the $\mathrm{PC}<7: 0>$ is provided by the instruction word. However, the $\mathrm{PC}<9: 8>$ will come from the $\mathrm{PCHBUF}<1: 0>$ register ( $\mathrm{PCHBUF} \rightarrow \mathrm{PCH}$ ).
PCHBUF register is never updated with the contents of PCH.

## CHENGPIN

FIGURE 2.2: Loading of PC in Different Situations

Situation 1: GOTO Instruction

Situation 2: CALL Instruction

Situation 3: RETIA, RETFIE, or RETURN Instruction

Situation 4: Instruction with PCL as destination

Note: PCHBUF is used only for instruction with PCL as destination for CP8056.

### 2.1.4 STATUS (Status Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 03h (r/w) | STATUS | GP2 | GP1 | GP0 | $\overline{\text { TO }}$ | $\overline{\text { PD }}$ | Z | DC | C |

This register contains the arithmetic status of the ALU, the RESET status.
If the STATUS Register is the destination for an instruction that affects the Z , DC or C bits, then the write to these three bits is disabled. These bits are set or cleared according to the device logic. Furthermore, the $\overline{\mathrm{TO}}$ and $\overline{\mathrm{PD}}$ bits are not writable. Therefore, the result of an instruction with the STATUS Register as destination may be different than intended. For example, CLRR STATUS will clear the upper three bits and set the $Z$ bit. This leaves the STATUS Register as 000u u1uu (where $u=$ unchanged).

C : Carry/borrow bit.
ADDAR, ADDIA
$=1$, a carry occurred.
$=0$, a carry did not occur.
SUBAR, SUBIA
= 1, a borrow did not occur.
$=0$, a borrow occurred.
Note : A subtraction is executed by adding the two's complement of the second operand. For rotate (RRR, RLR) instructions, this bit is loaded with either the high or low order bit of the source register.

DC : Half carry/half borrow bit.
ADDAR, ADDIA
= 1, a carry from the 4th low order bit of the result occurred.
$=0$, a carry from the 4th low order bit of the result did not occur.
SUBAR, SUBIA
= 1, a borrow from the 4th low order bit of the result did not occur.
$=0$, a borrow from the 4th low order bit of the result occurred.
Z: Zero bit.
$=1$, the result of a logic operation is zero.
$=0$, the result of a logic operation is not zero.
$\overline{\mathbf{P D}}$ : Power down flag bit.
= 1, after power-up or by the CLRWDT instruction.
$=0$, by the SLEEP instruction.
$\overline{\mathrm{TO}}$ : Time overflow flag bit.
= 1, after power-up or by the CLRWDT or SLEEP instruction.
$=0$, a watch-dog time overflow occurred.
GP2:GP0 : General purpose read/write bits.

### 2.1.5 FSR (Indirect Data Memory Address Pointer)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 04h (r/w) | FSR | $*$ | $*$ | Indirect data memory address pointer |  |  |  |  |  |

Bit5:Bit0 : Select registers address in the indirect addressing mode. See 2.1.1 for detail description.
Bit7:Bit6 : Not used. Read as "1"s.

### 2.1.6 PORTA \& PORTB (Port Data Registers)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05h $(\mathrm{r} / \mathrm{w})$ | PORTA | - | - | - | - | IOA3 | IOA2 | IOA1 | IOA0 |
| 06h $(\mathrm{r} / \mathrm{w})$ | PORTB | IOB7 | IOB6 | IOB5 | IOB4 | IOB3 | IOB2 | IOB1 | IOB0 |

Reading the port (PORTA, PORTB register) reads the status of the pins independent of the pin's input/output modes. Writing to these ports will write to the port data latch.
PORTA is a 4-bit port data Register. Only the low order 4 bits are used (PORTA<3:0>). Bits 7-4 are unimplemented and read as ' 0 's.
PORTB is a 8-bit port data register.

### 2.1.7 PCON (Power Control Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 08h (r/w) | PCON | WDTE | EIS | LVDTE | ROC | - | - | - | - |

Bit3:Bit0 : Not used. Read as "0"s.
ROC : R-option function of IOAO and IOA1 pins enable bit.
$=0$, Disable the R-option function.
= 1, Enable the R-option function. In this case, if a $430 \mathrm{~K} \Omega$ external resister is connected/disconnected to Vss, the status of IOA0 (IOA1) is read as " 0 " $/ 1$ ".

LVDTE : LVDT (low voltage detector) enable bit.
= 0, Disable LVDT.
= 1, Enable LVDT.
EIS : Define the function of IOBO/INT pin.
$=0$, IOBO (bi-directional I/O pin) is selected. The path of INT is masked.
$=1$, INT (external interrupt pin) is selected. In this case, the I/O control bit of IOB0 must be set to " 1 ". The path of Port B input change of IOB0 pin is masked by hardware, the status of INT pin can also be read by way of reading PORTB.

WDTE : WDT (watch-dog timer) enable bit.
= 0, Disable WDT.
$=1$, Enable WDT.

### 2.1.8 WUCON (Port B Input Change Interrupt/Wake-up Control Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 09h (r/w) | WUCON | WUB7 | WUB6 | WUB5 | WUB4 | WUB3 | WUB2 | WUB1 | WUB0 |

WUBO : = 0, Disable the input change interrupt/wake-up function of IOBO pin.
$=1$, Enable the input change interrupt/wake-up function of IOBO pin.
WUB1 : = 0, Disable the input change interrupt/wake-up function of IOB1 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB1 pin.
WUB2 : = 0, Disable the input change interrupt/wake-up function of IOB2 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB2 pin.
WUB3: $=0$, Disable the input change interrupt/wake-up function of IOB3 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB3 pin.

WUB4 : = 0, Disable the input change interrupt/wake-up function of IOB4 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB4 pin.
WUB5 : = 0, Disable the input change interrupt/wake-up function of IOB5 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB5 pin.
WUB6 : = 0, Disable the input change interrupt/wake-up function of IOB6 pin.
$=1$, Enable the input change interrupt/wake-up function of IOB6 pin.
WUB7 : = 0, Disable Enable the input change interrupt/wake-up function of IOB7 pin. $=1$, Enable the input change interrupt/wake-up function of IOB7 pin.

### 2.1.9 PCHBUF (High Byte Buffer of Program Counter)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| OAh (r/w) | PCHBUF | - | - | - | - | - |  | 2 MSBs Buffer of PC |  |

There are 2 bits in CP8056.
See 2.1.3 for detail description.

### 2.1.10 PDCON (Pull-down Control Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0Bh (r/w) | PDCON | /PDB3 | /PDB2 | /PDB1 | /PDB0 | /PDA3 | /PDA2 | /PDA1 | /PDA0 |

/PDAO : = 0 , Enable the internal pull-down of IOAO pin.
$=1$, Disable the internal pull-down of IOAO pin.
/PDA1 : = 0, Enable the internal pull-down of IOA1 pin.
$=1$, Disable the internal pull-down of IOA1 pin.
/PDA2 : = 0, Enable the internal pull-down of IOA2 pin.
$=1$, Disable the internal pull-down of IOA2 pin.
/PDA3 : = 0, Enable the internal pull-down of IOA3 pin.
$=1$, Disable the internal pull-down of IOA3 pin.
/PDB0 : = 0, Enable the internal pull-down of IOB0 pin.
$=1$, Disable the internal pull-down of IOBO pin.
/PDB1 : = 0, Enable the internal pull-down of IOB1 pin.
$=1$, Disable the internal pull-down of IOB1 pin.
/PDB2 : = 0, Enable the internal pull-down of IOB2 pin.
$=1$, Disable the internal pull-down of IOB2 pin.
/PDB3 : = 0, Enable the internal pull-down of IOB3 pin.
$=1$, Disable the internal pull-down of IOB3 pin.

### 2.1.11 ODCON (Open-drain Control Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0Ch (r/w) | ODCON | ODB7 | ODB6 | ODB5 | ODB4 | ODB3 | ODB2 | ODB1 | ODB0 |

ODB0 : = 0 , Disable the internal open-drain of IOBO pin.
$=1$, Enable the internal open-drain of IOB0 pin.
ODB1: = 0, Disable the internal open-drain of IOB1 pin. $=1$, Enable the internal open-drain of IOB1 pin.

ODB2 : = 0, Disable the internal open-drain of IOB2 pin. $=1$, Enable the internal open-drain of IOB2 pin.

ODB3 : = 0 , Disable the internal open-drain of IOB3 pin. $=1$, Enable the internal open-drain of IOB3 pin.

ODB4 : = 0, Disable the internal open-drain of IOB4 pin. $=1$, Enable the internal open-drain of IOB4 pin.

ODB5 : = 0 , Disable the internal open-drain of IOB5 pin. = 1, Enable the internal open-drain of IOB5 pin.

ODB6 : = 0, Disable the internal open-drain of IOB6 pin. = 1, Enable the internal open-drain of IOB6 pin.

ODB7 : = 0 , Disable the internal open-drain of IOB7 pin. $=1$, Enable the internal open-drain of $I O B 7$ pin.

### 2.1.12 PHCON (Pull-high Control Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0Dh (r/w) | PHCON | /PHB7 | /PHB6 | /PHB5 | /PHB4 | /PHB3 | /PHB2 | /PHB1 | /PHB0 |

/PHBO : = 0 , Enable the internal pull-high of IOBO pin. $=1$, Disable the internal pull-high of IOBO pin.
/PHB1 : = 0, Enable the internal pull-high of IOB1 pin.
$=1$, Disable the internal pull-high of IOB1 pin.
/PHB2 : = 0 , Enable the internal pull-high of IOB2 pin. $=1$, Disable the internal pull-high of IOB2 pin.
/PHB3 : = 0, Enable the internal pull-high of IOB3 pin.
= 1, Disable the internal pull-high of IOB3 pin.
/PHB4 : = 0 , Enable the internal pull-high of IOB4 pin. $=1$, Disable the internal pull-high of IOB4 pin.
/PHB5 : = 0, Enable the internal pull-high of IOB5 pin.
$=1$, Disable the internal pull-high of IOB5 pin.
/PHB6 : = 0, Enable the internal pull-high of IOB6 pin.
$=1$, Disable the internal pull-high of IOB6 pin.
/PHB7 : = 0, Enable the internal pull-high of IOB7 pin.
$=1$, Disable the internal pull-high of IOB7 pin.

### 2.1.13 INTEN (Interrupt Mask Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0Eh (r/w) | INTEN | GIE | - | - | - | - | INTIE | PBIE | T0IE |

TOIE : Timer0 overflow interrupt enable bit.
$=0$, Disable the Timer0 overflow interrupt.
= 1, Enable the Timer0 overflow interrupt.
PBIE : Port B input change interrupt enable bit.
= 0, Disable the Port B input change interrupt.
= 1, Enable the Port B input change interrupt .
INTIE : External INT pin interrupt enable bit.
$=0$, Disable the External INT pin interrupt.
= 1, Enable the External INT pin interrupt.
Bit6:BIT3 : Not used. Read as " 0 "s.

GIE : Global interrupt enable bit.
$=0$, Disable all interrupts. For wake-up from SLEEP mode through an interrupt event, the device will continue execution at the instruction after the SLEEP instruction.
= 1, Enable all un-masked interrupts. For wake-up from SLEEP mode through an interrupt event, the device will branch to the interrupt address (008h).
Note : When an interrupt event occur with the GIE bit and its corresponding interrupt enable bit are all set, the GIE bit will be cleared by hardware to disable any further interrupts. The RETFIE instruction will exit the interrupt routine and set the GIE bit to re-enable interrupt.

### 2.1.14 INTFLAG (Interrupt Status Register)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0Fh (r/w) | INTFLAG | - | - | - | - | - | INTIF | PBIF | T0IF |

TOIF : Timer0 overflow interrupt flag. Set when Timer0 overflows, reset by software.
PBIF : Port B input change interrupt flag. Set when Port B input changes, reset by software.
INTIF : External INT pin interrupt flag. Set by rising/falling (selected by INTEDG bit (OPTION<6>)) edge on INT pin, reset by software.

Bit7:BIT3 : Not used. Read as "0"s.

### 2.1.15 ACC (Accumulator)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N/A (r/w) | ACC | Accumulator |  |  |  |  |  |  |  |

Accumulator is an internal data transfer, or instruction operand holding. It can not be addressed.

### 2.1.16 OPTION Register

## CHENGPIN

CP8056

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N/A (w) | OPTION | - | INTEDG | T0CS | T0SE | PSA | PS2 | PS1 | PS0 |

By executing the OPTION instruction, the contents of the ACC Register will be transferred to the OPTION Register. The OPTION Register is a 7-bit wide, write-only register which contains various control bits to configure the Timer0/WDT prescaler, Timer0, and the external INT interrupt.
The OPTION Register are "write-only" and are set all "1"s except INTEDG bit.
PS2:PS0 : Prescaler rate select bits.

| PS2:PS0 | Timer0 Rate | WDT Rate |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | $1: 2$ | $1: 1$ |
| 0 | 0 | 1 | $1: 4$ | $1: 2$ |
| 0 | 1 | 0 | $1: 8$ | $1: 4$ |
| 0 | 1 | 1 | $1: 16$ | $1: 8$ |
| 1 | 0 | 0 | $1: 32$ | $1: 16$ |
| 1 | 0 | 1 | $1: 64$ | $1: 32$ |
| 1 | 1 | 0 | $1: 128$ | $1: 64$ |
| 1 | 1 | 1 | $1: 256$ | $1: 128$ |

PSA : Prescaler assign bit.
= 1, WDT (watch-dog timer).
$=0$, TMRO (Timer0).

TOSE : TMR0 source edge select bit.
$=1$, Falling edge on TOCKI pin.
= 0, Rising edge on TOCKI pin.
TOCS : TMRO clock source select bit.
= 1, External TOCKI pin.
$=0$, internal instruction clock cycle.
INTEDG : Interrupt edge select bit.
$=1$, interrupt on rising edge of INT pin.
$=0$, interrupt on falling edge of INT pin.

Bit7 : Not used.

### 2.1.17 IOSTA, \& IOSTB (Port I/O Control Registers)

| Address | Name | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N/A $(w)$ | IOSTA | Port A I/O Control Register |  |  |  |  |  |  |  |
| N/A (w) | IOSTB | Port B I/O Control Register |  |  |  |  |  |  |  |

The Port I/O Control Registers are loaded with the contents of the ACC Register by executing the IOST R (05h~06h) instruction. A ' 1 ' from a IOST Register bit puts the corresponding output driver in hi-impedance state (input mode). A ' 0 ' enables the output buffer and puts the contents of the output data latch on the selected pins (output mode). The IOST Registers are "write-only" and are set (output drivers disabled) upon RESET.

### 2.2 I/O Ports

Port A and port B are bi-directional tri-state I/O ports. Port A is a 4-pin I/O port. Port B is a 8-pin I/O ports. Port C is a general purpose register.
All I/O pins (IOA<3:0> and IOB<7:0>) have data direction control registers (IOSTA, IOSTB) which can configure these pins as output or input.
$I O B<7: 0>$ have its corresponding pull-high control bits (PHCON register) to enable the weak internal pull-high. The weak pull-high is automatically turned off when the pin is configured as an output pin.
$I O A<3: 0>$ and $I O B<3: 0>$ have its corresponding pull-down control bits (PDCON register) to enable the weak internal pull-down. The weak pull-down is automatically turned off when the pin is configured as an output pin.
IOB<7:0> have its corresponding open-drain control bits (ODCON register) to enable the open-drain output when these pins are configured to be an output pin.
IOAO and IOA1 are the R-option pins enabled by setting the ROC bit (PCON $<4>$ ). When the R-option function is used, it is recommended that IOA0 and IOA1 are used as output pins, and read the status of IOA0 and IOA1 before these pins are configured to be an output pin.
$I O B<7: 0>$ also provides the input change interrupt/wake-up function. Each pin has its corresponding input change interrupt/wake-up enable bits (WUCON) to select the input change interrupt/wake-up source.
The IOBO is also an external interrupt input signal by setting the EIS bit (PCON<6>). In this case, IOBO input change interrupt/wake-up function will be disabled by hardware even if it is enabled by software.

FIGURE 2.3: Block Diagram of I/O PINs
IOA3 ~ IOAO :

Pull-down is not shown in the figure

IOBO/INT :

Pull-high/pull-down and open-drain are not shown in the figure

IOB7 ~ IOB1 :

Pull-high/pull-down and open-drain are not shown in the figure

### 2.3 Timer0/WDT \& Prescler

### 2.3.1 Timer0

The Timer0 is a 8-bit timer/counter. The clock source of Timer0 can come from the internal clock or by an external clock source (TOCKI pin).

### 2.3.1.1 Using Timer0 with an Internal Clock : Timer mode

Timer mode is selected by clearing the TOCS bit (OPTION<5>). In timer mode, the timer0 register (TMR0) will increment every instruction cycle (without prescaler). If TMRO register is written, the increment is inhibited for the following two cycles.

### 2.3.1.2 Using Timer0 with an External Clock : Counter mode

Counter mode is selected by setting the TOCS bit (OPTON $<5>$ ). In this mode, Timer0 will increment either on every rising or falling edge of pin TOCKI. The incrementing edge is determined by the source edge select the rising edge. The external clock requirement is due to internal phase clock (Tosc) synchronization. Also, there is a delay in the actual incrementing of Timer0 after synchronization.
When no prescaler is used, the external clock input is the same as the prescaler output. The synchronization of TOCKI with the internal phase clocks is accomplished by sampling the prescaler output on the T2 and T4 cycles of the internal phase clocks. Therefore, it is necessary for TOCKI to be high for at least 2 Tosc and low for at least 2 Tosc.
When a prescaler is used, the external clock input is divided by the asynchronous prescaler. For the external clock to meet the sampling requirement, the ripple counter must be taken into account. Therefore, it is necessary for TOCKI to have a period of at least 4Tosc divided by the prescaler value.

### 2.3.2 Watchdog Timer (WDT)

The Watchdog Timer (WDT) is a free running on-chip RC oscillator which does not require any external components. So the WDT will still run even if the clock on the OSCI and OSCO pins is turned off, such as in SLEEP mode. During normal operation or in SLEEP mode, a WDT time-out will cause the device reset and the TO bit (STATUS<4>) will be cleared.
The WDT can be disabled by clearing the control bit WDTE (PCON<7>) to " 0 ".
The WDT has a nominal time-out period of 18 ms (without prescaler). If a longer time-out period is desired, a prescaler with a division ratio of up to $1: 128$ can be assigned to the WDT controlled by the OPTION register. Thus, the longest time-out period is approxmately 2.3 seconds.
The CLRWDT instruction clears the WDT and the prescaler, if assigned to the WDT, and prevents it from timing out and generating a device reset.
The SLEEP instruction resets the WDT and the prescaler, if assigned to the WDT. This gives the maximum SLEEP time before a WDT Wake-up Reset.

### 2.3.3 Prescaler

An 8-bit counter (down counter) is available as a prescaler for the Timer0, or as a postscaler for the Watchdog Timer (WDT). Note that the prescaler may be used by either the Timer0 module or the WDT, but not both. Thus, a prescaler assignment for the Timer0 means that there is no prescaler for the WDT, and vice-versa.
The PSA bit (OPTION<3>) determines prescaler assignment. The PS<2:0> bits (OPTION<2:0>) determine prescaler ratio.
When the prescaler is assigned to the Timer0 module, all instructions writing to the TMRO register will clear the prescaler. When it is assigned to WDT, a CLRWDT instruction will clear the prescaler along with the WDT. The prescaler is neither readable nor writable. On a RESET, the prescaler contains all ' 1 's.
To avoid an unintended device reset, CLRWDT or CLRR TMRO instructions must be executed when changing the prescaler assignment from Timer0 to the WDT, and vice-versa.

FIGURE 2.4: Block Diagram of The Timer0/WDT Prescaler

### 2.4 Interrupts

The CP8056 series has up to three sources of interrupt:

1. External interrupt INT pin.
2. TMR0 overflow interrupt.
3. Port B input change interrupt (pins IOB7:IOBO).

INTFLAG is the interrupt flag register that recodes the interrupt requests in the relative flags.
A global interrupt enable bit, GIE (INTEN<7>), enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be enabled/disabled through their corresponding enable bits in INTEN register regardless of the status of the GIE bit.
When an interrupt event occur with the GIE bit and its corresponding interrupt enable bit are all set, the GIE bit will be cleared by hardware to disable any further interrupts, and the next instruction will be fetched from address 008h. The interrupt flag bits must be cleared by software before re-enabling GIE bit to avoid recursive interrupts.
The RETFIE instruction exits the interrupt routine and set the GIE bit to re-enable interrupt.
The flag bit (except PBIF bit) in INTFLAG register is set by interrupt event regardless of the status of its mask bit. Reading the INTFLAG register will be the logic AND of INTFLAG and INTEN.
When an interrupt is generated by the INT instruction, the next instruction will be fetched from address 002 h .

### 2.4.1 External INT Interrupt

External interrupt on INT pin is rising or falling edge triggered selected by INTEDG (OPTION<6>).
When a valid edge appears on the INT pin the flag bit INTIF (INTFLAG<2>) is set. This interrupt can be disabled by clearing INTIE bit (INTEN<2>).
The INT pin interrupt can wake-up the system from SLEEP condition, if bit INTIE was set before going to SLEEP. If GIE bit was set, the program will execute interrupt service routine after wake-up; or if GIE bit was cleared, the program will execute next PC after wake-up.

### 2.4.2 Timer0 Interrupt

An overflow (FFh $\rightarrow 00 \mathrm{~h}$ ) in the TMRO register will set the flag bit TOIF (INTFLAG<0>). This interrupt can be disabled by clearing TOIE bit (INTEN<0>).

### 2.4.3 Port B Input Change Interrupt

An input change on IOB<7:0> set flag bit PBIF (INTFLAG<1>). This interrupt can be disabled by clearing PBIE bit (INTEN<1>).
Before the port B input change interrupt is enabled, reading PORTB (any instruction accessed to PORTB, including read/write instructions) is necessary. Any pin which corresponding WUBn bit (WUCON $<7: 0>$ ) is cleared to " 0 " or configured as output or IOBO pin configured as INT pin will be excluded from this function.
The port B input change interrupt also can wake-up the system from SLEEP condition, if bit PBIE was set before going to SLEEP. And GIE bit also decides whether or not the processor branches to the interrupt vector following wake-up. If GIE bit was set, the program will execute interrupt service routine after wake-up; or if GIE bit was cleared, the program will execute next PC after wake-up.

### 2.5 Power-down Mode (SLEEP)

Power-down mode is entered by executing a SLEEP instruction.
When SLEEP instruction is executed, the $\overline{\mathrm{PD}}$ bit (STATUS $<3>$ ) is cleared, the $\overline{\mathrm{TO}}$ bit is set, the watchdog timer will be cleared and keeps running, and the oscillator driver is turned off.
All I/O pins maintain the status they had before the SLEEP instruction was executed.

### 2.5.1 Wake-up from SLEEP Mode

The device can wake-up from SLEEP mode through one of the following events:

1. RSTB reset.
2. WDT time-out reset (if enabled).
3. Interrupt from RBO/INT pin, or PORTB change interrupt.

External RSTB reset and WDT time-out reset will cause a device reset. The $\overline{\mathrm{PD}}$ and $\overline{\mathrm{TO}}$ bits can be used to determine the cause of device reset. The $\overline{P D}$ bit is set on power-up and is cleared when SLEEP instruction is executed. The $\overline{\mathrm{TO}}$ bit is cleared if a WDT time-out occurred.
For the device to wake-up through an interrupt event, the corresponding interrupt enable bit must be set. Wake-up is regardless of the GIE bit. If GIE bit is cleared, the device will continue execution at the instruction after the SLEEP instruction. If the GIE bit is set, the device will branch to the interrupt address (008h).
The system wake-up delay time is 18 ms plus 128 oscillator cycle time.

### 2.6 Reset

CP8056 devices may be RESET in one of the following ways:

1. Power-on Reset (POR)
2. Brown-out Reset (BOR)
3. RSTB Pin Reset
4. WDT time-out Reset

Some registers are not affected in any RESET condition. Their status is unknown on Power-on Reset and unchanged in any other RESET. Most other registers are reset to a "reset state" on Power-on Reset, RSTB or WDT Reset.
A Power-on RESET pulse is generated on-chip when Vdd rise is detected. To use this feature, the user merely ties the RSTB pin to Vdd.
On-chip Low Voltage Detector (LVD) places the device into reset when Vdd is below a fixed voltage. This ensures that the device does not continue program execution outside the valid operation Vdd range. Brown-out RESET is typically used in AC line or heavy loads switched applications.
A RSTB or WDT Wake-up from SLEEP also results in a device RESET, and not a continuation of operation before SLEEP.
The $\overline{\mathrm{TO}}$ and $\overline{\mathrm{PD}}$ bits (STATUS<4:3>) are set or cleared depending on the different reset conditions.

### 2.6.1 Power-up Reset Timer(PWRT)

The Power－up Reset Timer provides a nominal 18ms delay after Power－on Reset（POR），Brown－out Reset（BOR）， RSTB Reset or WDT time－out Reset．The device is kept in reset state as long as the PWRT is active．
The PWDT delay will vary from device to device due to Vdd，temperature，and process variation．

## 2．6．2 Oscillator Start－up Timer（OST）

The OST timer provides a 128 oscillator cycle delay（from OSCI input）after the PWRT delay（18ms）is over．This delay ensures that the X＇tal oscillator or resonator has started and stabilized．The device is kept in reset state as long as the OST is active．
This counter only starts incrementing after the amplitude of the OSCI signal reaches the oscillator input thresholds．

## 2．6．3 Reset Sequence

When Power－on Reset（POR），Brown－out Reset（BOR），RSTB Reset or WDT time－out Reset is detected，the reset sequence is as follows：
1．The reset latch is set and the PWRT \＆OST are cleared．
2．When the internal POR，BOR，RSTB Reset or WDT time－out Reset pulse is finished，then the PWRT begins counting．
3．After the PWRT time－out，the OST is activated．
4．And after the OST delay is over，the reset latch will be cleared and thus end the on－chip reset signal． The totally system reset delay time is 18 ms plus 128 oscillator cycle time．

CP8056

### 2.7 Hexadecimal Convert to Decimal (HCD)

Decimal format is another number format for CP8056. When the content of the data memory has been assigned as decimal format, it is necessary to convert the results to decimal format after the execution of ALU instructions. When the decimal converting operation is processing, all of the operand data (including the contents of the data memory (RAM), accumulator (ACC), immediate data, and look-up table) should be in the decimal format, or the results of conversion will be incorrect.
Instruction DAA can convert the ACC data from hexadecimal to decimal format after any addition operation and restored to ACC.
The conversion operation is illustrated in example 2.2.

## EXAMPLE 2.2: DAA CONVERSION

| MOVIA | 90h | ;Set immediate data = decimal format number "90" (ACC ¢90h) |
| :---: | :---: | :---: |
| MOVAR | 30h | ;Load immediate data "90" to data memory address 30H |
| MOVIA | 10h | ;Set immediate data = decimal format number "10" (ACC < 10h) |
| ADDAR | 30h, 0 | ;Contents of the data memory address 30 H and ACC are binary-added ;the result loads to the ACC $(A C C \leftarrow A O h, C \leftarrow 0)$ |
| DAA |  | ;Convert the content of ACC to decimal format, and restored to ACC ;The result in the ACC is " 00 " and the carry bit C is " 1 ". This represents the ;decimal number "100" |

Instruction DAS can convert the ACC data from hexadecimal to decimal format after any subtraction operation and restored to ACC.
The conversion operation is illustrated in example 2.3.

## EXAMPLE 2.3: DAS CONVERSION

| MOVIA | 10h | ;Set immediate data = decimal format number "10" (ACC ¢ 10h) |
| :---: | :---: | :---: |
| MOVAR | 30h | ;Load immediate data "10" to data memory address 30H |
| MOVIA | 20h | ;Set immediate data = decimal format number "20" (ACC < 20h) |
| SUBAR | 30h, 0 | ;Contents of the data memory address 30 H and ACC are binary-subtracted ;the result loads to the ACC $(A C C \leftarrow F O h, C \leftarrow 0)$ |
| DAS |  | ;Convert the content of ACC to decimal format, and restored to ACC ;The result in the ACC is " 90 " and the carry bit C is " 0 ". This represents the ;decimal number "-10" |

### 2.8 Oscillator Configurations

CP8056 can be operated in four different oscillator modes. Users can program two configuration bits (Fosc<1:0>) to select the appropriate modes:

- LF: Low Frequency Crystal Oscillator
- XT: Crystal/Resonator Oscillator
- HF: High Frequency Crystal/Resonator Oscillator
- RC: Resistor/Capacitor Oscillator

In LF, XT, or HF modes, a crystal or ceramic resonator in connected to the OSCI and OSCO pins to establish oscillation. When in LF, XT, or HF modes, the devices can have an external clock source drive the OSCI pin. The RC device option offers additional cost savings for timing insensitive applications. The RC oscillator frequency is a function of the supply voltage, the resistor (Rext) and capacitor (Cext), the operating temperature, and the process parameter.

| RLR | R, d | Rotate left fthrough Carry | $\begin{aligned} & R<7>\rightarrow C, \\ & R<6: 0>\rightarrow \text { dest }<7: 1>, \\ & C \rightarrow \text { dest }<0> \end{aligned}$ | 1 | C |

| RRR | R, d | Rotate right f through Carry | $\begin{aligned} & C \rightarrow \text { dest<7>, } \\ & R<7: 1>\rightarrow \text { dest<6:0>, } \\ & R<0>\rightarrow C \end{aligned}$ | 1 | C |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SWAPR | R, d | Swap R | $\begin{aligned} & R<3: 0>\rightarrow \text { dest<7:4>, } \\ & R<7: 4>\rightarrow \text { dest<3:0> } \end{aligned}$ | 1 | - |
| MOVIA | 1 | Move Immediate to ACC | $1 \rightarrow$ ACC | 1 | - |
| ADDIA | 1 | Add ACC and Immediate | $1+$ ACC $\rightarrow$ ACC | 1 | C, DC, Z |
| SUBIA | I | Subtract ACC from Immediate | $1-$ ACC $\rightarrow$ ACC | 1 | C, DC, Z |
| ANDIA | 1 | AND Immediate with ACC | ACC and I $\rightarrow$ ACC | 1 | Z |
| IORIA | 1 | OR Immediate with ACC | ACC or I $\rightarrow$ ACC | 1 | Z |
| XORIA | I | Exclusive OR Immediate to ACC | ACC xor I $\rightarrow$ ACC | 1 | Z |
| RETIA | I | Return, place Immediate in ACC | $\begin{aligned} & \mathrm{I} \rightarrow \text { ACC, } \\ & \text { Top of Stack } \rightarrow \text { PC } \end{aligned}$ | 2 | - |
| CALL | I | Call subroutine | $\begin{aligned} & \mathrm{PC}+1 \rightarrow \text { Top of Stack, } \\ & \mathrm{I} \rightarrow \mathrm{PC}<9: 0> \end{aligned}$ | 2 | - |
| GOTO | 1 | Unconditional branch | $1 \rightarrow \mathrm{PC}<9: 0>$ | 2 | - |

Note: 1. 2 cycles for skip, else 1 cycle
2. bit : Bit address within an 8 -bit register $R$

R : Register address ( 00 h to 3 Fh )
I : Immediate data
ACC : Accumulator
d : Destination select;
$=0$ (store result in ACC)
$=1$ (store result in file register R )
dest : Destination
PC : Program Counter
PCHBUF : High Byte Buffer of Program Counter
WDT : Watchdog Timer Counter
GIE : Global interrupt enable bit
$\overline{\mathrm{TO}}$ : Time-out bit
$\overline{P D}$ : Power-down bit
C : Carry bit
DC : Digital carry bit
Z: Zero bit

| ADCAR | Add ACC and R with Carry |
| :---: | :---: |
| Syntax: | ADCAR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $\mathrm{R}+\mathrm{ACC}+\mathrm{C} \rightarrow$ dest |
| Status Affected: | C, DC, Z |
| Description: | Add the contents of the ACC register and register ' $R$ ' with Carry. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is ' 1 ' the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| ADDAR | Add ACC and R |
| Syntax: | ADDAR R, d |
| Operands: | $0 \leq R \leq 63$ |
| Operation: | ACC $+\mathrm{R} \rightarrow$ dest |
| Status Affected: | C, DC, Z |
| Description: | Add the contents of the ACC register and register ' $R$ '. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is ' 1 ' the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| ADDIA | Add ACC and Immediate |
| Syntax: | ADDIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | ACC + I $\rightarrow$ ACC |
| Status Affected: | C, DC, Z |
| Description: | Add the contents of the ACC register with the 8 -bit immediate ' I '. The result is placed in the ACC register. |
| Cycles: | 1 |
| ANDAR | AND ACC and R |
| Syntax: | ANDAR R, d |
| Operands: | $\begin{aligned} & 0 \leq R \leq 63 \\ & d \in[0,1] \end{aligned}$ |
| Operation: | ACC and $R \rightarrow$ dest |
| Status Affected: | Z |
| Description: | The contents of the ACC register are AND'ed with register ' $R$ '. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is ' 1 ' the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| ANDIA | AND Immediate with ACC |
| Syntax: | ANDIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | ACC AND I $\rightarrow$ ACC |
| Status Affected: | Z |
| Description: | The contents of the ACC register are AND'ed with the 8 -bit immediate ' l '. The result is placed in the ACC register. |
| Cycles: | 1 |

| BCR | Clear Bit in R |
| :---: | :---: |
| Syntax: | BCF R, b |
| Operands: | $0 \leq R \leq 63$ |
|  | $0 \leq b \leq 7$ |
| Operation: | $0 \rightarrow R<b>$ |
| Status Affected: | None |
| Description: | Clear bit 'b' in register ' R '. |
| Cycles: | 1 |
| BSR | Set Bit in R |
| Syntax: | BSR R, b |
| Operands: | $0 \leq R \leq 63$ |
|  | $0 \leq b \leq 7$ |
| Operation: | $1 \rightarrow \mathrm{R}<\mathrm{b}>$ |
| Status Affected: | None |
| Description: | Set bit 'b' in register 'R'. |
| Cycles: | 1 |
| BTRSC | Test Bit in R, Skip if Clear |
| Syntax: | BTRSC R, b |
| Operands: | $0 \leq R \leq 63$ |
|  | $0 \leq \mathrm{b} \leq 7$ |
| Operation: | Skip if $\mathrm{R}<\mathrm{b}>=0$ |
| Status Affected: | None |
| Description: | If bit ' $b$ ' in register ' $R$ ' is 0 then the next instruction is skipped. If bit ' $b$ ' is 0 then next instruction fetched during the current instruction execution is discarded, and a NOP is executed instead making this a 2 -cycle instruction.. |
| Cycles: | 1(2) |
| BTRSS | Test Bit in R, Skip if Set |
| Syntax: | BTRSS R, b |
| Operands: | $0 \leq R \leq 63$ |
|  | $0 \leq \mathrm{b} \leq 7$ |
| Operation: | Skip if $\mathrm{R}<\mathrm{b}>=1$ |
| Status Affected: | None |
| Description: | If bit ' $b$ ' in register ' $R$ ' is ' 1 ' then the next instruction is skipped. If bit ' $b$ ' is ' 1 ', then the next instruction fetched during the current instruction execution, is discarded and a NOP is executed instead, making this a 2-cycle instruction. |
| Cycles: | 1(2) |
| CALL | Subroutine Call |
| Syntax: | CALL I |
| Operands: | $0 \leq \mathrm{I} \leq 1023$ |
| Operation: | PC +1 $\rightarrow$ Top of Stack; |
|  | $1 \rightarrow \mathrm{PC}<9: 0>$ |
|  | PCHBUF<2> $\rightarrow$ PC<10> |
| Status Affected: | None |
| Description: | Subroutine call. First, return address ( $\mathrm{PC}+1$ ) is pushed onto the stack. The 10 -bit immediate address is loaded into PC bits $\langle 9: 0\rangle$. CALL is a two-cycle instruction. |
| Cycles: | 2 |

## CHENGPIN

| CLRA | Clear ACC |
| :---: | :---: |
| Syntax: | CLRA |
| Operands: | None |
| Operation: | $\begin{aligned} & 00 \mathrm{~h} \rightarrow \mathrm{ACC} ; \\ & 1 \rightarrow \mathrm{Z} \end{aligned}$ |
| Status Affected: | Z |
| Description: | The ACC register is cleared. Zero bit ( $Z$ ) is set. |
| Cycles: | 1 |
| CLRR | Clear R |
| Syntax: | CLRR R |
| Operands: | $0 \leq R \leq 63$ |
| Operation: | 00h $\rightarrow$ R; |
|  | $1 \rightarrow$ Z |
| Status Affected: | Z |
| Description: | The contents of register ' R ' are cleared and the Z bit is set. |
| Cycles: | 1 |
| CLRWDT | Clear Watchdog Timer |
| Syntax: | CLRWDT |
| Operands: | None |
| Operation: | 00h $\rightarrow$ WDT; |
|  | 00h $\rightarrow$ WDT prescaler (if assigned); |
|  | $1 \rightarrow \overline{\mathrm{TO}}$; |
|  | $1 \rightarrow \overline{\mathrm{PD}}$ |
| Status Affected: | $\overline{\mathrm{TO}}$ PD |
| Description: | The CLRWDT instruction resets the WDT. It also resets the prescaler, if the prescaler is assigned to the WDT and not Timer0. Status bits $\overline{\mathrm{TO}}$ and $\overline{\mathrm{PD}}$ are set. |
| Cycles: | 1 |
| COMR | Complement R |
| Syntax: | COMR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $\mathrm{R} \rightarrow$ dest |
| Status Affected: | Z |
| Description: | The contents of register ' $R$ ' are complemented. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is 1 the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| DAA | Adjust ACC's data format from HEX to DEC |
| Syntax: | DAA |
| Operands: | None |
| Operation: | ACC(hex) $\rightarrow$ ACC(dec) |
| Status Affected: | C |
| Description: | Convert the ACC data from hexadecimal to decimal format after any addition operation and restored to ACC. |
| Cycles: | 1 |

| DAS | Adjust ACC's data format from HEX to DEC |
| :--- | :--- |
| Syntax: | DAS |
| Operands: | None |
| Operation: | ACC(hex) $\rightarrow$ ACC(dec) |
| Status Affected: | None |
| Description: | Convert the ACC data from hexadecimal to decimal format after any subtraction operation |
|  | and restored to ACC. |
| Cycles: | 1 |
| DECR | Decrement $\mathbf{R}$ |

| INCRSZ | Increment R, Skip if 0 |
| :---: | :---: |
| Syntax: | INCRSZ R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $\mathrm{R}+1 \rightarrow$ dest, skip if result $=0$ |
| Status Affected: | None |
| Description: | The contents of register ' $R$ ' are incremented. If ' $d$ ' is 0 the result is placed in the ACC register. If ' $d$ ' is the result is placed back in register ' $R$ '. |
| J.com | If the result is 0 , then the next instruction, which is already fetched, is discarded and a NOP is executed instead making it a two-cycle instruction. |
| Cycles: | 1(2) |
| INT | S/W Interrupt |
| Syntax: | INT |
| Operands: | None |
| Operation: | PC + $1 \rightarrow$ Top of Stack, $002 h \rightarrow$ PC |
| Status Affected: | None |
| Description: | Interrupt subroutine call. First, return address ( $\mathrm{PC}+1$ ) is pushed onto the stack. The address 002h is loaded into PC bits <9:0>. |
| Cycles: | 3 |
| IORAR | OR ACC with R |
| Syntax: | IORAR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | ACC or $\mathrm{R} \rightarrow$ dest |
| Status Affected: | Z |
| Description: | Inclusive OR the ACC register with register ' $R$ '. If ' $d$ ' is 0 the result is placed in the ACC register. If ' $d$ ' is 1 the result is placed back in register ' $R$ '. |
| Cycles: | 1 |
| IORIA | OR Immediate with ACC |
| Syntax: | IORIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | ACC or I $\rightarrow$ ACC |
| Status Affected: | Z |
| Description: | The contents of the ACC register are OR'ed with the 8 -bit immediate ' I '. The result is placed in the ACC register. |
| Cycles: | 1 |
| IOST | Load IOST Register |
| Syntax: | IOST R |
| Operands: | $\mathrm{R}=5,6$ or 7 |
| Operation: | ACC $\rightarrow$ IOST register R |
| Status Affected: | None |
| Description: | IOST register ' $R$ ' ( $R=5,6$ or7) is loaded with the contents of the ACC register. |
| Cycles: | 1 |

| MOVAR | Move ACC to R |
| :---: | :---: |
| Syntax: | MOVAR R |
| Operands: | $0 \leq R \leq 63$ |
| Operation: | ACC $\rightarrow$ R |
| Status Affected: | None |
| Description: | Move data from the ACC register to register ' $R$ '. |
| Cycles: | 1 |
| MOVIA | Move Immediate to ACC |
| Syntax: | MOVIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | $1 \rightarrow$ ACC |
| Status Affected: | None |
| Description: Cycles: | The 8-bit immediate 'l' is loaded into the ACC register. The don't cares will assemble as 0s. 1 |
| MOVR | Move R |
| Syntax: | MOVR R, d |
| Operands: | $\begin{aligned} & 0 \leq R \leq 63 \\ & d \in[0,1] \end{aligned}$ |
| Operation: | $\mathrm{R} \rightarrow$ dest |
| Status Affected: | Z |
| Description: | The contents of register ' $R$ ' is moved to destination ' $d$ '. If ' $d$ ' is 0 , destination is the ACC register. If ' $d$ ' is 1 , the destination is file register ' $R$ '. ' $d$ ' is 1 is useful to test a file register since status flag $Z$ is affected. |
| Cycles: | 1 |
| NOP | No Operation |
| Syntax: | NOP |
| Operands: | None |
| Operation: | No operation |
| Status Affected: | None |
| Description: | No operation. |
| Cycles: | 1 |
| OPTION | Load OPTION Register |
| Syntax: | OPTION |
| Operands: | None |
| Operation: | ACC $\rightarrow$ OPTION |
| Status Affected: | None |
| Description: | The content of the ACC register is loaded into the OPTION register. |
| Cycles: | 1 |
| RETFIE | Return from Interrupt, Set 'GIE' Bit |
| Syntax: | RETFIE |
| Operands: | None |
| Operation: | Top of Stack $\rightarrow$ PC |
| Status Affected: | None |
| Description: | The program counter is loaded from the top of the stack (the return address). The 'GIE' bit is set to 1 . This is a two-cycle instruction. |
| Cycles: | 2 |

| RETIA | Return with Immediate in ACC |
| :---: | :---: |
| Syntax: | RETIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | $1 \rightarrow$ ACC; |
|  | Top of Stack $\rightarrow$ PC |
| Status Affected: | None |
| Description: | The ACC register is loaded with the 8 -bit immediate ' 1 '. The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction. |
| Cycles: | 2 |
| RETURN | Return from Subroutine |
| Syntax: | RETURN |
| Operands: | None |
| Operation: | Top of Stack $\rightarrow$ PC |
| Status Affected: | None |
| Description: | The program counter is loaded from the top of the stack (the return address). This is a two-cycle instruction. |
| Cycles: | 2 |
| RLR | Rotate Left fthrough Carry |
| Syntax: | RLR R, d |
| Operands: | $\begin{aligned} & 0 \leq R \leq 63 \\ & d \in[0,1] \end{aligned}$ |
| Operation: | $\begin{aligned} & R<7>\rightarrow C ; \\ & R<6: 0>\rightarrow \text { dest }<7: 1>; \\ & C \rightarrow \text { dest }<0> \end{aligned}$ |
| Status Affected: | C |
| Description: | The contents of register ' $R$ ' are rotated one bit to the left through the Carry Flag. If ' $d$ ' is 0 the result is placed in the ACC register. If ' $d$ ' is 1 the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| RRR | Rotate Right f through Carry |
| Syntax: | RRR R, d |
| Operands: | $0 \leq R \leq 63$ |
| Operation: | $\begin{aligned} & C \rightarrow \text { dest }<7>\text {; } \\ & R<7: 1>\rightarrow \text { dest<6:0>; } \\ & R<0>\rightarrow C \end{aligned}$ |
| Status Affected: | C |
| Description: | The contents of register ' $R$ ' are rotated one bit to the right through the Carry Flag. If ' $d$ ' is 0 the result is placed in the ACC register. If ' $d$ ' is 1 the result is placed back in register ' $R$ '. |
| Cycles: | 1 |

## CHENGPIN

| SLEEP | Enter SLEEP Mode |
| :---: | :---: |
| Syntax: | SLEEP |
| Operands: | None |
| Operation: | 00h $\rightarrow$ WDT; |
|  | 00h $\rightarrow$ WDT prescaler; |
|  | $1 \rightarrow$ TO; |
|  | $0 \rightarrow$ PD |
| Status Affected: | TO PD |
| Description: | Time-out status bit ( $\overline{\mathrm{TO}}$ ) is set. The power-down status bit ( $\overline{\mathrm{PD}}$ ) is cleared. The WDT and its prescaler are cleared. |
|  | The processor is put into SLEEP mode. |
| Cycles: | 1 |
| SBCAR | Subtract ACC from R with Carry |
| Syntax: | SBCAR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $\mathrm{R}+\overline{\mathrm{ACC}}+\mathrm{C} \rightarrow$ dest |
| Status Affected: | C, DC, Z |
| Description: | Add the 2's complement method of the ACC register from register ' $R$ ' with Carry. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is 1 the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| SUBAR | Subtract ACC from R |
| Syntax: | SUBAR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $\mathrm{R}-\mathrm{ACC} \rightarrow$ dest |
| Status Affected: | C, DC, Z |
| Description: | Subtract (2's complement method) the ACC register from register ' $R$ '. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is 1 the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| SUBIA | Subtract ACC from Immediate |
| Syntax: | SUBAR R, d |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | $1-$ ACC $\rightarrow$ ACC |
| Status Affected: | C, DC, Z |
| Description: | Subtract (2's complement method) the ACC register from the 8-bit immediate ' l '. The result is placed in the ACC register. |
| Cycles: | 1 |
| SWAPR | Swap nibbles in $\mathbf{R}$ |
| Syntax: | SWAPR R, d |
| Operands: | $0 \leq R \leq 63$ |
|  | $\mathrm{d} \in[0,1]$ |
| Operation: | $R<3: 0>\rightarrow$ dest<7:4>; |
|  | R<7:4> $\rightarrow$ dest<3:0> |
| Status Affected: | None |
| Description: | The upper and lower nibbles of register ' $R$ ' are exchanged. If ' $d$ ' is 0 the result is placed in ACC register. If ' $d$ ' is 1 the result in placed in register ' $R$ '. |
| Cycles: | 1 |

| XORAR | Exclusive OR ACC with R |
| :---: | :---: |
| Syntax: | XORAR R, d |
| Operands: | $\begin{aligned} & 0 \leq R \leq 63 \\ & d \in[0,1] \end{aligned}$ |
| Operation: | ACC xor $R \rightarrow$ dest |
| Status Affected: | Z |
| Description: | Exclusive OR the contents of the ACC register with register ' $R$ '. If ' $d$ ' is 0 the result is stored in the ACC register. If ' $d$ ' is 1 the result is stored back in register ' $R$ '. |
| Cycles: | 1 |
| XORIA | Exclusive OR Immediate with ACC |
| Syntax: | XORIA I |
| Operands: | $0 \leq 1 \leq 255$ |
| Operation: | ACC xor I $\rightarrow$ ACC |
| Status Affected: | Z |
| Description: | The contents of the ACC register are XOR'ed with the 8-bit immediate ' 1 '. The result is placed in the ACC register. |
| Cycles: | 1 |

## CHENGPIN
