VACUUM FLUORESCENT DISPLAY DRIVERS

D2914, OCTOBER 1985 REVISED OCTOBER 1989

- Drives Up to 20 Lines
- 70-V Output Voltage Swing Capability
- 40-mA Output Source Current Capability
- High-Speed Serially-Shifted Data Input
- CMOS-Compatible Inputs
- Direct Replacement for Sprague UCN5812A

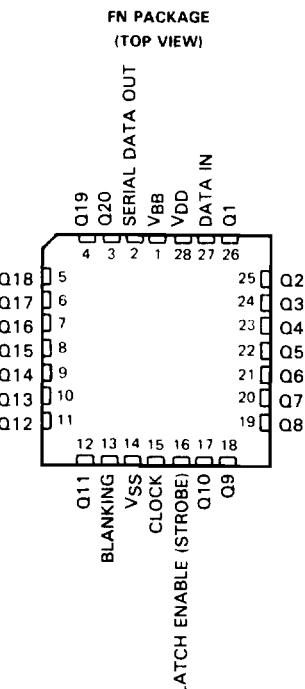

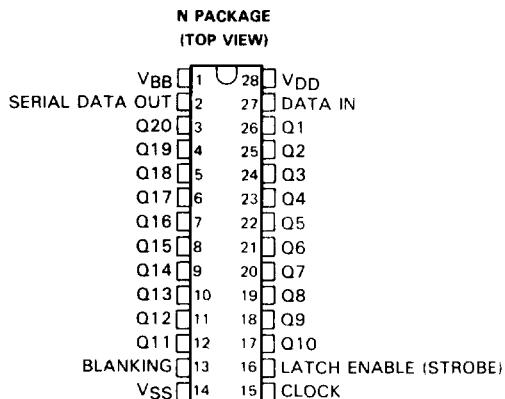

description

The TLC5812I and TLC5812 are monolithic BIDFET[†] integrated circuits designed to drive a dot matrix or segmented vacuum fluorescent display (VFD). Each device features a serial data output to cascade additional devices for large display arrays.

A 20-bit data word is serially loaded into the shift register on the low-to-high transition of CLOCK. Parallel data is transferred to the output buffers through a 20-bit D-type latch while LATCH ENABLE is high and is latched when LATCH ENABLE is low. When BLANKING is high, all outputs are low.

The outputs are totem-pole structures formed by n-p-n emitter-follower and double-diffused MOS (DMOS) transistors with output voltage ratings of 70 V and a source-current capability of 40 mA. All inputs are CMOS compatible.

The TLC5812I is characterized for operation from -40°C to 85°C. The TLC5812 is characterized for operation from 0°C to 70°C.

[†]BIDFET — Bipolar, double-diffused, N-channel and P-channel MOS transistors on the same chip — patented process.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

BLANK	X X	X X	H L	As determined above	Determined by LATCH ENABLE [‡]	R20 R20	All L LC1 thru LC20, respectively

H = high level, L = low level, X = irrelevant, t = low-to-high-level transition.

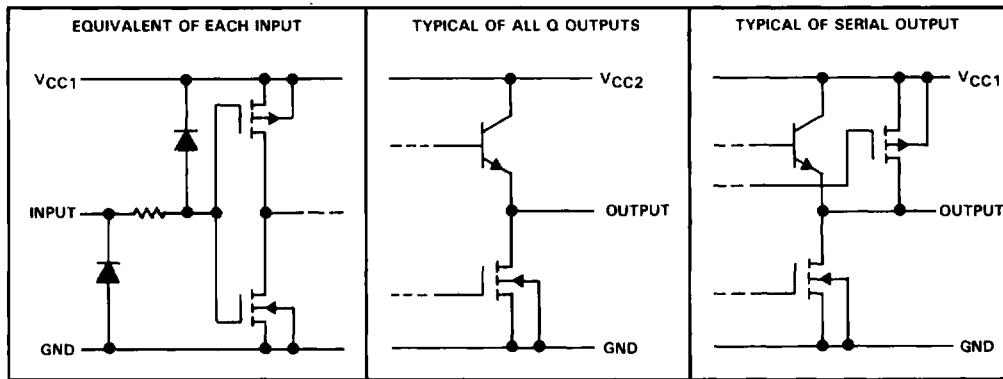

[†]R20 takes on the state of R19, R19 takes on the state of R18, . . . R2 takes on the state of R1, and R1 takes on the state of the data input.

[‡]New data enter the latches while LATCH ENABLE is high. These data are stored while LATCH ENABLE is low.
