

MOS INTEGRATED CIRCUIT

μ PD789011, 789012

8-BIT SINGLE-CHIP MICROCONTROLLER

Phase-out/Discontinued

The μ PD789011 and 789012 are products in the μ PD789014 Subseries of compact, general-purpose microcontrollers in the 78K/0S Series. In addition to an 8-bit CPU, these products have substantial hardware such as on-chip I/O ports, timers, serial interface, and interrupt controls.

The μ PD78P9014, one-time PROM product that can be written only once, and various development tools are also available.

These user's manuals contain detailed descriptions of the functions. Be sure to read them before designing.

FEATURES

- ROM and RAM capacity

Item	Program Memory	Data Memory (Internal	Package
Product Name	(ROM)	High-Speed RAM)	
μ PD789011	2 Kbytes	128 bytes	28-pin plastic shrink DIP (400 mil)
μ PD789012	4 Kbytes		28-pin plastic SOP (375 mil)

- Minimum instruction execution time changeable to the high-speed (0.4 μ s) and the low-speed (1.6 μ s)
- I/O ports: 22
- Serial interface: 1 channel
3-wire serial I/O mode/UART mode selectable
- Timers: 3 channels
 - 8-bit timer/event counter: 2 channels
 - Watchdog timer: 1 channel
- Power supply voltage : V_{DD} = 1.8 to 5.5 V

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 Ports

The μ PD789011 and 789012 are provided with the ports shown below, which enable various types of control.

Table 5-1. Port Functions

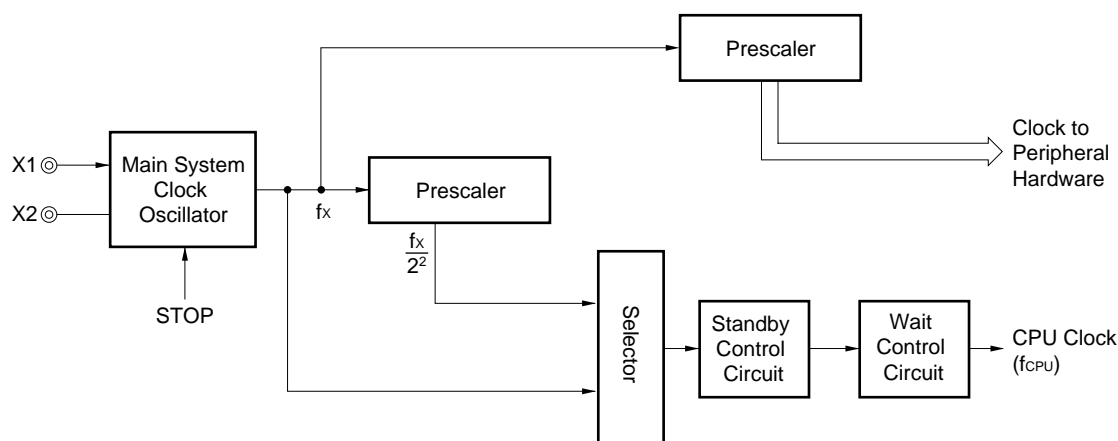

Name	Pin Name	Function
Port 0	P00 to P07	8-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 1	P10 to P17	8-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 2	P20 to P22	3-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.
Port 3	P30 to P32	3-bit input/output port. Input/output can be specified bit-wise. When used as an input port, on-chip pull-up resistor can be used by software.

5.2 Clock Generator

The main system clock generator is incorporated. Also, the minimum instruction execution can be changed.

- 0.4 μ s/1.6 μ s (at 5.0-MHz operation with main system clock)

Figure 5-1. Clock Generator Block Diagram

5.3 Timer

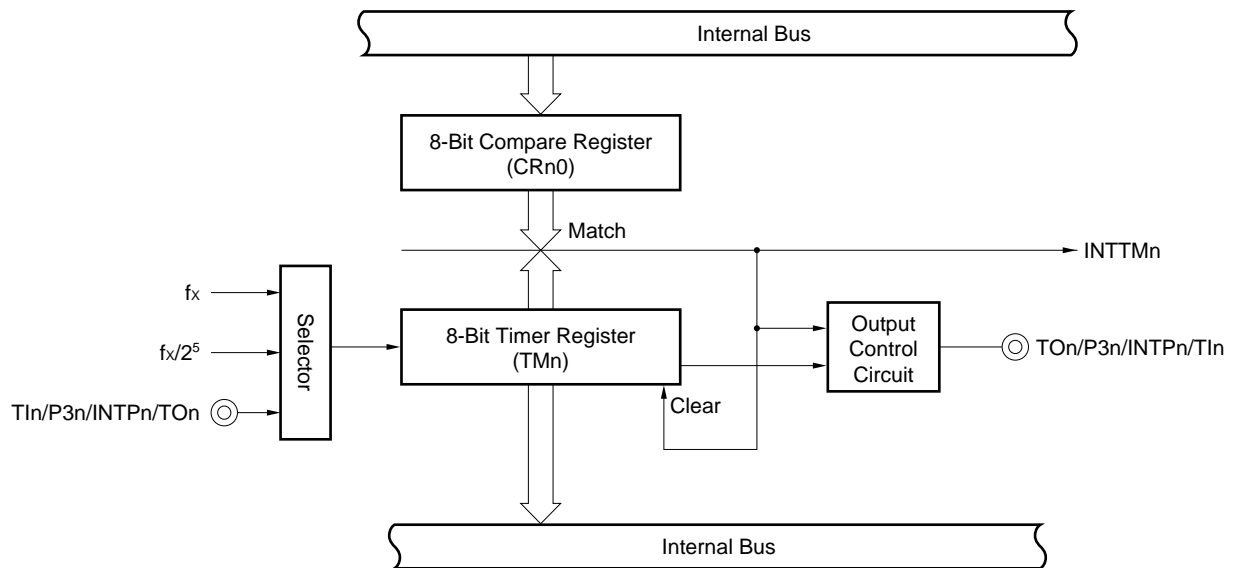

The μ PD789011 and 789012 incorporate 3 channels of the timer.

- 8-bit timer/event counter : 2 channels
- Watchdog timer : 1 channel

Table 5-2. Operations of Timer

		8-bit Timer/Event Counter	Watchdog Timer
Operation mode	Interval timer	2 channels	1 channel
	External event counter	2 channels	—
Function	Timer output	2 outputs	—
	Interrupt request	2	1

Remark n = 0 or 1

Figure 5-3. Watchdog Timer Block Diagram

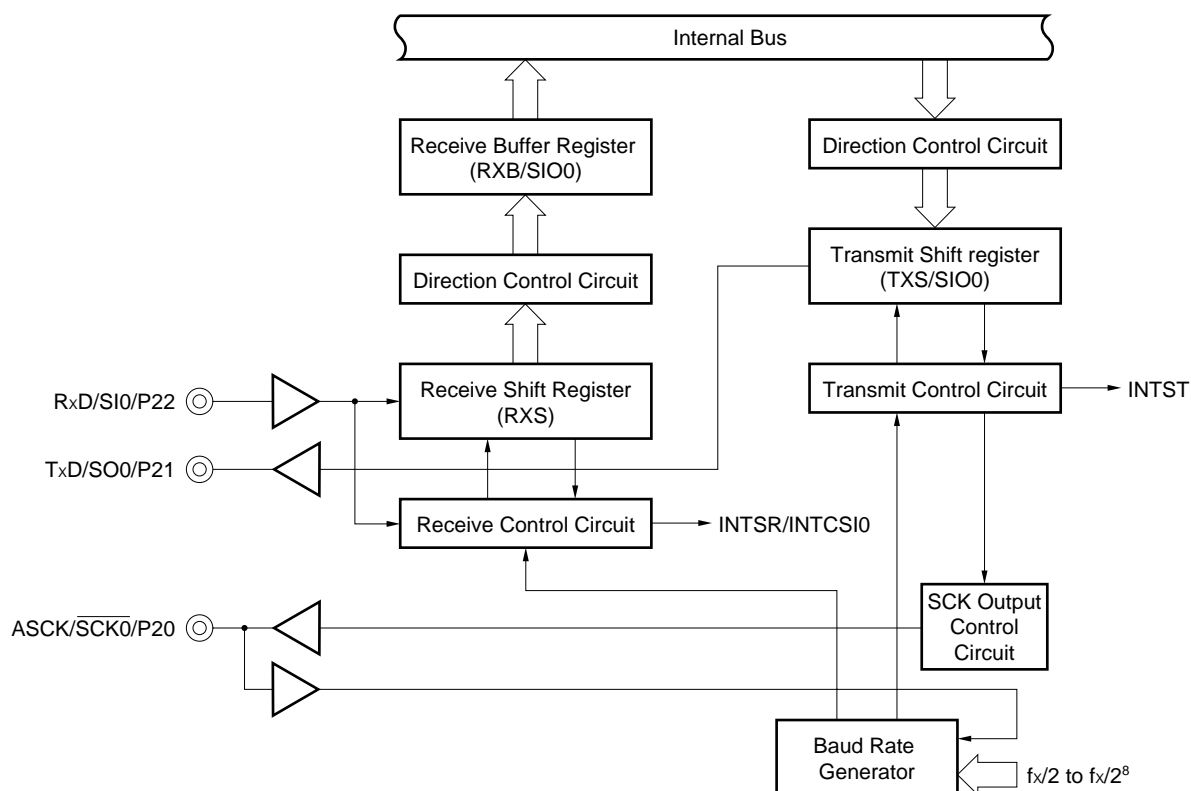

5.4 Serial Interface

1 channel of serial interface is incorporated.

Serial interface channel 0 has the following two modes.

- 3-wire serial I/O mode : MSB/LSB first switchable
- Asynchronous serial interface (UART) mode : Dedicated baud rate generator incorporated

Figure 5-4. Serial Interface Channel 0 Block Diagram

6. INTERRUPT FUNCTIONS

There are 10 interrupt functions of 2 different sources as follows.

- Non-maskable : 1
- Maskable : 9

Table 6-1. Interrupt Source List

Interrupt Type	Priority ^{Note 1}	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type ^{Note 2}
		Name	Trigger			
Non-maskable	—	INTWDT	Watchdog timer overflow (when the watchdog timer mode 1 is selected)	Internal	0004H	(A)
Maskable	0	INTWDT	Watchdog timer overflow (when the interval timer mode is selected)			(B)
	1	INTP0	Pin input edge detection	External	0006H	(C)
	2	INTP1			0008H	
	3	INTP2			000AH	
	4	INTSR	Completion of serial interface channel 0 UART reception	Internal	000CH	(B)
		INTCSI0	Completion of serial interface channel 0 3-wire transfer			
	5	INTST	Completion of serial interface channel 0 UART transmission		000EH	
	6	INTTM0	Generation of matching signal of 8-bit timer/ event counter 0		0010H	
	7	INTTM1	Generation of matching signal of 8-bit timer/ event counter 1		0012H	

Notes 1. The priority is the priority order when two or more maskable interrupt requests are generated simultaneously. 0 is the highest order and 7 the lowest.

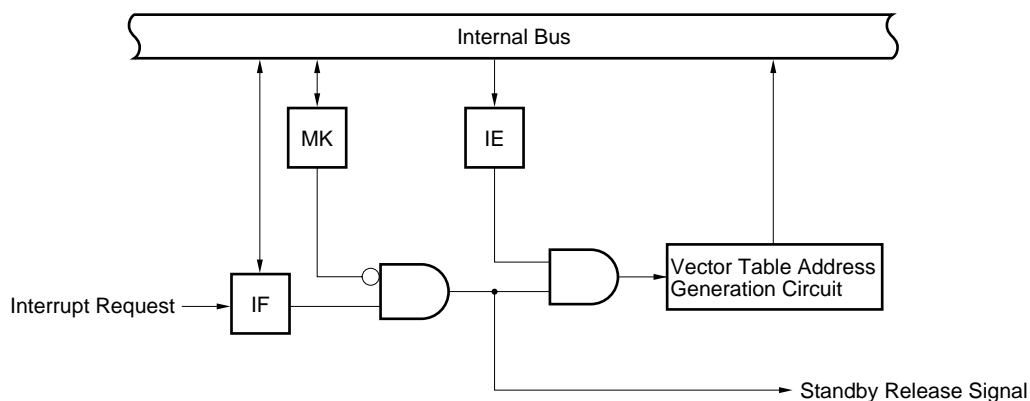

2. Basic configuration types (A) to (C) correspond to those in Figure 6-1, respectively.

(A) Internal non-maskable interrupt

(B) Internal maskable interrupt

(C) External maskable interrupt

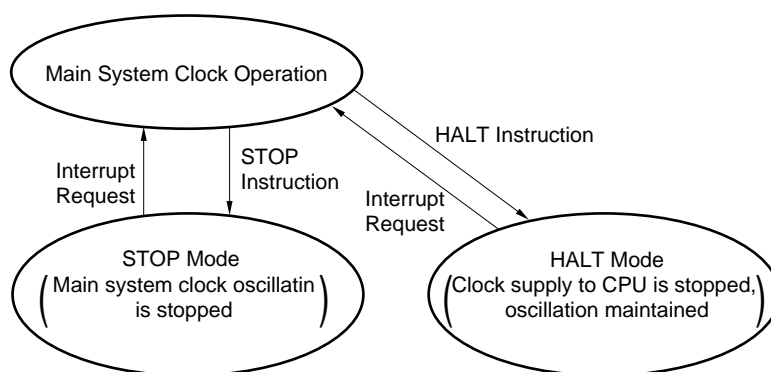

IF : Interrupt request flag
 IE : Interrupt enable flag
 MK : Interrupt mask flag

7. STANDBY FUNCTIONS

There are the following two standby functions to reduce the system power consumption.

- HALT mode : The CPU operation clock is stopped.
The average current consumption can be reduced by intermittent operation in combination with the normal operation mode.
- STOP mode: The main system clock oscillation is stopped. All the operations performed on the main system clock is stopped, and power consumption becomes extremely small.

Figure 7-1. Standby Function

8. RESET FUNCTIONS

There are the following two reset methods.

- External reset input by $\overline{\text{RESET}}$ pin
- Internal reset by watchdog timer runaway time detection

9. OVERVIEW OF THE INSTRUCTION SET

The instruction set of μPD789011 and 789012 is shown in the table below.

9.1 Legend

9.1.1 Operand identifiers and methods of use

Operands are described in "Operand" column of each instruction in accordance with the description method of the instruction operand identifier (refer to the assembler specifications for detail). When there are two or more description methods, select one of them. Alphabetic letters in capitals and symbols, #, !, \$, and [] are keywords and must be described as they are. Each symbol has the following meaning.

- # : Immediate data specification
- ! : Absolute address specification
- \$: Relative address specification
- [] : Indirect address specification

In the case of immediate data, describe an appropriate numeric value or a label. When using a label, Be sure to describe the #, !, \$, and [] symbols.

For operand register identifiers, r and rp, either function names (X, A, C, etc.) or absolute names (names in parentheses in the table below, R0, R1, R2, etc.) can be used for description.

Table 9-1. Operand Identifiers and Description Methods

Identifier	Description Method
r	X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7)
rp	AX (RP0), BC (RP1), DE (RP2), HL (RP3)
sfr	Special-function register symbol
saddr	FE20H to FF1FH Immediate data or labels
saddrp	FE20H to FF1FH Immediate data or labels (even addresses only)
addr16	0000H to FFFFH Immediate data or labels (Only even addresses in a 16-bit data transfer instructions)
addr5	0040H to 007FH Immediate data or labels (even addresses only)
word	16-bit immediate data or label
byte	8-bit immediate data or label
bit	3-bit immediate data or label

9.1.2 Description of “Operation” column

A	: A register ; 8-bit accumulator
X	: X register
B	: B register
C	: C register
D	: D register
E	: E register
H	: H register
L	: L register
AX	: AX register pair; 16-bit accumulator
BC	: BC register pair
DE	: DE register pair
HL	: HL register pair
PC	: Program counter
SP	: Stack pointer
PSW	: Program status word
CY	: Carry flag
AC	: Auxiliary carry flag
Z	: Zero flag
IE	: Interrupt request enable flag
NMIS	: Non-maskable interrupt servicing flag
()	: Memory contents indicated by the address or register contents in parentheses
X _H , X _L	: High 8 bits and low 8 bits of a 16-bit register
^	: Logical product (AND)
∨	: Logical sum (OR)
⊕	: Exclusive logical sum (exclusive OR)
—	: Inverted data
addr16	: 16-bit immediate data or label
jdisp8	: signed 8-bit data (displacement value)

9.1.3 Description of “Flag Operation” column

(Blank)	: Unchanged
0	: Clear to 0.
1	: Set to 1.
×	: Set/cleared according to the result
R	: Previously saved value is restored.

		Total of all pins	Peak value	-30	mA
			r.m.s.	-15	mA
Output current, low	I_{OL} ^{Note}	1 pin	Peak value	30	mA
			r.m.s.	15	mA
		Total of all pins	Peak value	160	mA
			r.m.s.	80	mA
Operating ambient temperature	T_A			-40 to +85	$^\circ\text{C}$
Storage temperature	T_{stg}			-65 to +150	$^\circ\text{C}$

Note The r.m.s. should be calculated as follows : $[\text{r.m.s.}] = [\text{peak value}] \times \sqrt{\text{duty}}$

Caution Product quality may suffer if the absolute maximum rating is exceeded for even single parameter or even momentarily. That is, the absolute maximum ratings are the rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions which ensure that the absolute maximum ratings are not exceeded.

Remark The characteristics of an alternate function pin and a port pin are the same unless specified otherwise.

		X1 input high/low level width (t_{xH} , t_{xL})		100		500	ns

Notes 1. Indicates only oscillation circuit characteristics. Refer to AC characteristics for instruction execution time.

2. Time required to stabilize oscillation after reset or STOP mode release.

Caution When using the main system clock oscillator, wiring the area enclosed with the dotted line should be carried out as follows to avoid an adverse effect from wiring capacitance.

- Wiring should be as short as possible.
- Wiring should not cross other signal lines.
- Wiring should not be placed close to a varying higher current.
- The potential of the oscillator capacitor ground should be the same as V_{SS} .
- Do not ground wiring to a ground pattern in which a high current flows.
- Do not fetch a signal from the oscillator.

	CSA5.00MGU		30	30	2.0	5.5	
	CST5.00MGWU		—	—			Product containing capacitor

Note If the ceramic resonator is the CSB1000J (1.0 MHz) by Murata Mfg. Co., Ltd., the limiting resistor ($R_d = 1.0\text{ k}\Omega$) is needed (see the following figure). If another recommended oscillator is used, the limiting resistor is not needed.

Caution The oscillation circuit constants and oscillation voltage range indicate conditions for stable oscillation but do not guarantee the accuracy of the oscillation frequency. If the application circuit requires accuracy of the oscillation frequency, it is necessary to set the oscillation frequency of the resonator in the application circuit. For this, it is necessary to directly contact manufacturer of the resonator being used.

Partial heating	Pin temperature: 300°C max., Duration: 3 seconds max. (per device side)	—

Note The storage conditions are 25°C and 65% RH for the number of storage days after opening the seal of the dry pack.

Caution Using more than one soldering method should be avoided. (except in the case of partial heating)

Table 12-2. Soldering Conditions for Through-hole Devices

μPD789011CT-xxx : 28-pin Plastic Shrink DIP (400 mil)

μPD789012CT-xxx : 28-pin Plastic Shrink DIP (400 mil)

Soldering Method	Soldering Conditions
Wave soldering (pin only)	Solder bath temperature: 260 °C max., Duration: 10 seconds max.
Partial heating	Pin temperature: 300 °C max., Duration: 3 seconds max.(per pin)

Caution Wave soldering is only for the lead part in order that jet solder cannot contact with the chip directly.

★ APPENDIX A. DEVELOPMENT TOOLS

The following development tools are available for the development of systems that employ the μ PD789011 and 789012.

Language Processing Software

RA78K0S ^{Notes 1, 2, 3}	78K/0S Series common assembler package
CC78K0S ^{Notes 1, 2, 3}	78K/0S Series common C compiler package
DF789014 ^{Notes 1, 2, 3}	μ PD789014 Subseries common device file
CC78K0S-L ^{Notes 1, 2, 3, 5}	78K/0S Series common C compiler library source file

PROM Writing Tools

PG-1500	PROM programmer
PA-78P9014GT	PROM programmer adapter connected to PG-1500
PG-1500 controller	PG-1500 control program

Debugging Tools

IE-78K0S-NS ^{Note 5}	In-circuit emulator common to 78K/0S Series
IE-70000-98-IF-B ^{Note 5}	Interface adapter when PC-9800 Series (except for notebooks) is used as host machine of IE-78K0S-NS.
IE-70000-98N-IF ^{Note 5}	Interface adapter and cable when PC-9800 Series notebook is used as host machine of IE-78K0S-NS.
IE-70000-PC-IF-B ^{Note 5}	Interface adapter when IBM PC/AT TM or its compatibles is used as host machine of IE-78K0S-NS.
IE-789014-NS-EM1 ^{Note 5}	Emulation board for μ PD789014 Subseries
NP-28CT ^{Note 4}	Emulation probe for 28-pin plastic shrink DIP
NP-28GT ^{Note 4}	Emulation probe for 28-pin plastic SOP
SM78K0S ^{Notes 1, 2, 3}	System simulator common to 78K/0S Series
DF789014 ^{Notes 1, 2, 3}	Device file in common with μ PD7890914 Subseries

Real-Time OS

MX78K0S ^{Notes 1, 2}	78K/0S Series OS
-------------------------------	------------------

- Notes**
1. PC-9800 Series (MS-DOSTM + WindowsTM) based
 2. IBM PC/AT and compatibles (PC DOSTM/IBM DOSTM/MS-DOS + Windows) based
 3. HP9000 Series 700TM (HP-UXTM) based, SPARCstationTM (SunOSTM) based, NEWSTM (NEWS-OSTM) based
 4. This is a product of Naito Densai Machida Seisakusho Co., Ltd. (044-822-3813). To purchase, contact Naito Densai Machida Seisakusho Co., Ltd.

NOTES FOR CMOS DEVICES

① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS

Note: Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

② HANDLING OF UNUSED INPUT PINS FOR CMOS

Note: No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS device behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Note: Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customers must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices is "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact an NEC sales representative in advance.

Anti-radioactive design is not implemented in this product.
