Applications Information

- ◇ Designed to protect one data, I/O, or power supply line.
- ◇ Designed to protect sensitive electronics from damage or latch-up due to ESD
- ◇ Designed to replace multilayer varistors (MLVs) in portable applications
- ◇ Offers superior electrical characteristics such as lower clamping voltage and no device degradation when compared to MLVs
- ◇ The combination of small size and high ESD surge capability makes them ideal for use in portable applications.

Circuit Board Layout Recommendations

- Good circuit board layout is critical for the suppression of ESD induced transients.
- ◇ Place the ESD Protection Diode near the input terminals or connectors to restrict transient coupling.
 - ◇ Minimize the path length between the ESD Protection Diode and the protected line.
 - ◇ Minimize all conductive loops including power and ground loops.
 - ◇ The ESD transient return path to ground should be kept as short as possible.

Note 1: A_0 , B_0 , and K_0 are determined by component size. The clearance between the components and the cavity must be within 0.05 mm min. to 0.5 mm max. The component cannot rotate more than 10° within the determined cavity.

Note 2: If B_1 exceeds 4.2 mm (0.165") for 8 mm embossed tape, the tape may not feed through all tape feeders.
