

Features

- Supply-voltage Range: 2.7 V to 5.5 V
- Single-ended Output, no Balun Required
- Single-ended Input for RF and LO
- Excellent Isolation Characteristics
- Power-down Mode
- IP3 and Compression Point Programmable
- 2.5-GHz Operating Frequency

Benefits

- Reduced System Costs as only Few External Component (no Balun) are Required
- Small Package
- Very Low Current Consumption
- Easy to Use

Electrostatic sensitive device.

Observe precautions for handling.

2.5-GHz Double- balanced Mixer

U2795B

Description

The U2795B is a 2.5-GHz mixer for WLAN and RF telecommunications equipment, e.g., DECT and PCN. The IC is manufactured using Atmel's advanced bipolar technology. A double-balanced approach was chosen to assure good isolation characteristics and a minimum of spurious products. The input and output are single-ended, and their characteristics are programmable. No output transformer or balun is required.

Figure 1. Block Diagram

Pin Configuration

Figure 2. Pinning

Pin Description

Pin	Symbol	Function
1	VS	Supply voltage
2	RFI	RF input
3	P	Programming port IP3, CP
4	SO	Output symmetry
5	IFO	IF output
6	GND	Ground
7	LOI	LO input
8	PU	Power-up

Functional Description

Supply Voltage

The IC is designed for a supply-voltage range of 2.7 V to 5.5 V. As the IC is internally stabilized, the performance of the circuit is nearly independent of the supply voltage.

Input Impedance

The input impedance, Z_{RFI} , is about 700 Ω with an additional capacitive component. This condition provides the best noise figure in combination with a matching network.

3rd Order Intercept Point (IP3)

The voltage divider, R_P/R_1 , determinates both the input and output intercept point, IIP3 and OIP3. If the value of R_P is infinite, the maximum value of IIP3 reach about -4 dBm. The IP3/ R_P characteristics are shown in Figure 3 and Figure 4.

Output Impedance and Intercept Point

The output impedance is shown in Figure 11 on page 8. Both low output impedance and a high intercept point are defined to a high value of R_P .

Current Consumption, I_S

Depending on the chosen input and output conditions of the IC, the current consumption, I_S , is between 4 mA and 10 mA. The current consumption in dependence of R_P is shown in Figure 6 on page 6.

Power-up

This feature provides extended battery lifetime. If this function is not used, pin 8 has to be connected to V_S (pin 1).

Output Symmetry

The symmetry of the load current can be matched and thus optimized for a given load impedance.

Absolute Maximum Ratings

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Application

Table 1. Part List

Part	Value
C_1	10 nF
$C_2, C_3, C_4, C_5, C_6, C_7$	100 pF
$*R_P$	
	50-Ω Microstrip
$*R_{SO}$	68 Ω
	optional
R_T	56 Ω

If the part-list values are used, the PU settling time is $< 20 \mu\text{s}$. Using other values, time requirements in burst-mode applications have to be considered.

The values of R_{SO} and R_P depend on the input and output condition requirements. For R_{SO} , 68 Ω is recommended.

By means of the optional R_I , the intercept and compression point can be slightly increased; values between 500 Ω and 1 kΩ are suitable. Please note that such modification will also increase the supply current.
