

# NCP4620

## 150 mA, 10 V, Low Dropout Regulator

The NCP4620 is a CMOS Linear voltage regulator with 150 mA output current capability. The device is capable of operating with input voltages up to 10 V, with high output voltage accuracy and low temperature–drift coefficient. The NCP4620 is easy to use, with output current fold–back protection and a thermal shutdown circuit included. A Chip Enable function is included to save power by lowering supply current.

### Features

- Operating Input Voltage Range: 2.6 V to 10 V
- Output Voltage Range: 1.2 V to 6.0 V (available in 0.1 V steps)
- Output Voltage Accuracy:  $\pm 1.0\%$
- Low Supply Current: 23  $\mu\text{A}$
- Low Dropout: 165 mV ( $I_{\text{OUT}} = 100 \text{ mA}$ ,  $V_{\text{OUT}} = 3.3 \text{ V}$ )  
400 mV ( $I_{\text{OUT}} = 150 \text{ mA}$ ,  $V_{\text{OUT}} = 2.8 \text{ V}$ )
- High PSRR: 70 dB at 1 kHz
- Line Regulation 0.02%/V Typ
- Current Fold Back Protection
- Thermal Shutdown Protection
- Stable with Ceramic Capacitors
- Available in SC–70 and SOT23 Packages
- These are Pb–Free Devices\*

### Typical Applications

- Battery products powered by 2 Lithium Ion cells
- Networking and Communication Equipment
- Cameras, DVRs, STB and Camcorders
- Toys, industrial applications

Figure 1. Typical Application Schematic

## PIN FUNCTION DESCRIPTION

Pin No. SC-70	Pin No. SOT23	Pin Name	Description
5	1	VIN	Input pin
3	2	GND	Ground
1	3	CE	Chip enable pin (Active "H")
4	5	VOUT	Output pin
2	4	NC	No connection

## ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	$V_{IN}$	12.0	V
Output Voltage	$V_{OUT}$	-0.3 to $V_{IN} + 0.3$	V
Chip Enable Input	$V_{CE}$	12.0	V
Output Current	$I_{OUT}$	165	mA
Power Dissipation - SC-70	$P_D$	380	mW
Power Dissipation - SOT23		420	
Operating Temperature	$T_A$	-40 to +85	°C
Maximum Junction Temperature	$T_J$	+150	°C
Storage Temperature	$T_{STG}$	-55 to +125	°C
ESD Capability, Human Body Model (Note 2)	$ESD_{HBM}$	2000	V
ESD Capability, Machine Model (Note 2)	$ESD_{MM}$	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

- Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
- This device series incorporates ESD protection and is tested by the following methods:  
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)  
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)  
 Latchup Current Maximum Rating tested per JEDEC standard: JESD78.

## APPLICATION INFORMATION

A typical application circuit for NCP4620 series is shown in Figure 38.

Figure 38. Typical Application Schematic

#### Input Decoupling Capacitor (C1)

A 1  $\mu$ F ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4620. Higher values and lower ESR improves line transient response.

#### Output Decoupling Capacitor (C2)

A 1  $\mu$ F ceramic output decoupling capacitor is enough to achieve stable operation of the IC. If a tantalum capacitor is used, and its ESR is high, loop oscillation may result. The capacitors should be connected as close as possible to the output and ground pins. Larger values and lower ESR improves dynamic parameters.

#### Enable Operation

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull down current source. If the enable function is not needed connect CE pin to VIN.

#### Output Discharger

The D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

#### Thermal

As a power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

#### PCB layout

Make the VIN and GND line as large as practical. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.
