

H11F1 H11F2 H11F3

DESCRIPTION

The H11F series consists of a Gallium-Aluminum-Arsenide IRED emitting diode coupled to a symmetrical bilateral silicon photo-detector. The detector is electrically isolated from the input and performs like an ideal isolated FET designed for distortion-free control of low level AC and DC analog signals. The H11F series devices are mounted in dual in-line packages.

FEATURES

As a remote variable resistor

- $\leq 100\Omega$ to $\geq 300\text{ M}\Omega$
- $\geq 99.9\%$ linearity
- $\leq 15\text{ pF}$ shunt capacitance
- $\geq 100\text{ G}\Omega$ I/O isolation resistance

As an analog switch

- Extremely low offset voltage
- $60\text{ V}_{\text{pk-pk}}$ signal capability
- No charge injection or latch-up
- $t_{\text{on}}, t_{\text{off}} \leq 15\ \mu\text{S}$
- UL recognized (File #E90700)
- VDE recognized (File #E94766)
 - Ordering option '300' (e.g. H11F1.300)

APPLICATIONS

As a variable resistor –

- Isolated variable attenuator
- Automatic gain control
- Active filter fine tuning/band switching

As an analog switch –

- Isolated sample and hold circuit
- Multiplexed, optically isolated A/D conversion

TYPICAL APPLICATIONS

AS A VARIABLE RESISTOR

ISOLATED VARIABLE ATTENUATORS

Distortion free attenuation of low level A.C. signals is accomplished by varying the IRED current, I_F . Note the wide dynamic range and absence of coupling capacitors; D.C. level shifting or parasitic feedback to the controlling function.

AS AN ANALOG SIGNAL SWITCH

ISOLATED SAMPLE AND HOLD CIRCUIT

Accuracy and range are improved over conventional FET switches because the H11F has no charge injection from the control signal. The H11F also provides switching of either polarity input signal up to 30V magnitude.

AUTOMATIC GAIN CONTROL

This simple circuit provides over 70db of stable gain control for an AGC signal range of from 0 to 30mA. This basic circuit can be used to provide programmable fade and attack for electronic music.

MULTIPLEXED, OPTICALLY-ISOLATED A/D CONVERSION

The optical isolation, linearity and low offset voltage of the H11F allows the remote multiplexing of low level analog signals from such transducers as thermocouples, Hall effect devices, strain gauges, etc. to a single A/D converter.

ACTIVE FILTER FINE TUNING/BAND SWITCHING

The linearity of resistance and the low offset voltage of the H11F allows the remote tuning or band-switching of active filters without switching glitches or distortion. This schematic illustrates the concept, with current to the H11F1 IRED's controlling the filter's transfer characteristic.

TEST EQUIPMENT - KELVIN CONTACT POLARITY

In many test equipment designs the auto polarity function uses reed relay contacts to switch the Kelvin Contact polarity. These reeds are normally one of the highest maintenance cost items due to sticking contacts and mechanical problems. The totally solid-State H11F eliminates these troubles while providing faster switching.
