CMOS IC

QUADRUPLE BUS BUFFER GATE WITH 3-STATE OUTPUTS

DESCRIPTION

The **U74AHC125** is a quadruple bus buffer gate with 3-state output. When \overline{OE} is high, the Y output is in a high-impedance state. When \overline{OE} is low, the device passes non inverted data from the A input to the Y output.

To ensure the high-impedance state during power up or power down, \overline{OE} should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

FEATURES

- * Wide supply voltage range from 2V to 5.5V
- * Max t_{PD} of 3.8ns from A to Y at 5V, $C_L=15pF$
- * Low Quiescent Current: $I_{CC} = 4 \mu A$ (Max.) at 5.5V
- * ± 8 mA Output Driver at 5V
