## CMOS Dual 4-Stage Static Shift Register

### ■ DESCRIPTION

**UCD4015** consists of two identical, independent, 4-stage serial-input/parallel-output registers. Each register has independent CLOCK and RESET input as well as a single serial DATA input. "Q" outputs are available from each of the four stages on both registers. All registers stages are D-type, master-slave flip-flops. The logic level present at the DATA input is transferred into the first register stage and shifted over one stage at each positive-going clock transition. Resetting of all stages is accomplished by a high level on the reset line. Register expansion to 8 stages using one UCD4015 package or to more than 8 stages using additional UCD4015's is possible.

### ■ FEATURES

- \* 12MHz (typ.) clock rate at 10V
- \* Maximum input current of 1µA at 18V
- \* Fully static operation
- \* 8 master-slave flip-flops plus input and output buffering

### ■ APPLICATIONS

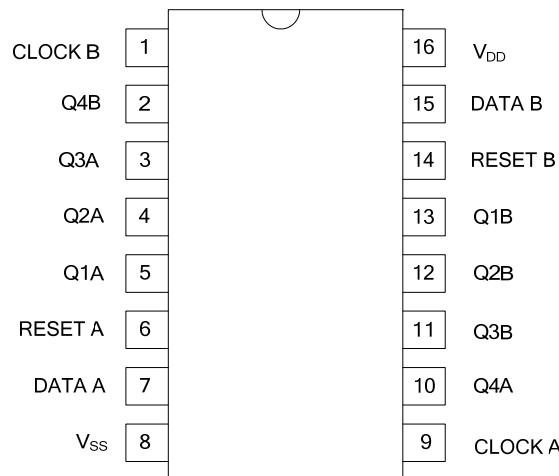

- \* General-purpose register
- \* Serial-input/parallel-output data queueing
- \* Serial to parallel data conversion
