1310nm Dual Channel Optical Transmitter

TRPV3GET2C000E2G

Pb

Product Description

The TRPV3GET2C000E2G is a dual channel optical transmitter module designed to transmit optical serial digital signals as defined in SMPTE 297-2006. The module is specifically designed for robust performance in the presence of SDI pathological patterns for SMPTE 259M, SMPTE 344M, SMPTE 292M and SMPTE 424M serial rates.

The SFP transmitter provides an excellent solution for transmission at 1310nm to provide error-free transmission of signals from 50Mbps to 3Gbps over single mode fiber. The product is RoHS 6/6 compliant and is designed and tested in accordance with industry safety standards. The transceiver is Class I laser product per U.S. FDA/CDRH and international IEC-60825 standards.

The TRPV3GET2C000E2G connects to standard 20-pad SFP connector and supports hot-plug capability. This allows the system designer to make configuration changes or maintenance by simply plugging in different transceivers without removing the power supply from the host system.

The SFP transmitter also provides extensive operational status monitoring through an I²C interface. Output optical power, bias current, supply voltage and operating temperature are monitored. If a parameter monitored is outside the pre-defined range, the alarm/warning flag associated with the parameter will be raised.

Features

☑ Features two transmitters in one SFP package

☑ Multirate from 50Mbps to 3Gbps for up to 30km single-mode fiber

☑ Maximum distance of 10km under worst case conditions and 3Gbps video pathological signals

☑ Supports video pathological patterns for SD-SDI, HD-SDI and 3G-SDI

☑ Digital diagnostics and control via I²C interface

☑ Low power consumption (Typically 600mW)

☑ RoHS compliant

☑ SMPTE 297-2006 compatible

Application Notes

Electrical Interface: Signal interfaces are compatible with the SFP MSA specification. The high speed DATA interface is differential AC-coupled internally and can be directly connected to a 3.3V SERDES IC. All low speed control and sense output signals are open collector TTL compatible and should be pulled up with a 4.7 - 10kΩ resistor on the host board.

TX_Fault: The output indicates LOW when the transmitter is operating normally and HIGH with a laser fault including laser end-of-life. TX Fault is an open collector/drain output and should be pulled up with a 4.7 - 10kΩ resistor on the host board.

TX_Disable: When the TX Disable pin is at logic HIGH, the transmitter optical output is disabled. The laser is also disabled if this line is left floating, as it is pulled high inside the transceiver.

Serial Identification and Monitoring: The module definition of SFP is indicated by the MOD_ABS pin and the 2-wrie serial interface. Upon power up, the 2-wrie interface appears as NC (no connection), and MOD_ABS is TTL LOW. When the host system detects this condition, it activates the serial protocol (standard two-wire I²C serial interface) and generates the serial clock signal (SCL). The positive edge clocks data into the EEPROM segments of the device that are not write protected, and the negative edge clocks data from the device. The serial data signal (SDA) is for serial data transfer. The host uses SDA in conjunction with SCL to mark the start and end of serial protocol activation. The supported monitoring functions are temperature, voltage, bias current, transmitter power, all alarms and warnings, and software monitoring of TX Fault. The device is internally calibrated.

The data transfer protocol and the details of the mandatory and vendor specific data structures are defined in the SFP MSA, and SFF-8472, Rev. 9.4.
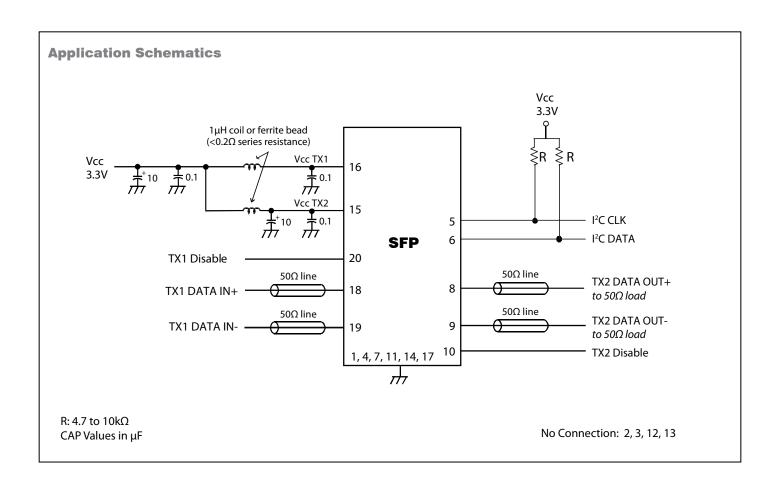

Power Supply and Grounding: The power supply line should be well-filtered. All power supply bypass capacitors should be as close to the transceiver module as possible.

Interfacing the Transceivers

Communication is via a serial 2-wire serial interface. As described in the document SFF-8472 (REV. 9.4) there are two distinct address spaces:

Base Address A0(hex)	
Byte Address	**Content**
0 – 95	Serial Transceiver ID as defined in SFP MSA
96 – 127	OPLINK Specific
128 – 255	Reserved

Base Address A2(hex)	
Byte Address	**Content**
0 - 55	Alarm & Warnings thresholds & limits
56 - 95	External calibration constants (not used)
96 – 119	Values from real time diagnostic monitoring
120 – 127	Not used
128 – 247	Customer specific, writable area
248 - 255	Not used
