Video switch for CANAL-Plus decoder
BA7630S / BA7630F

The BA7630S and BA7630F are decoder switching ICs for the scrambled broadcasts in France. The ICs include a 3-input multiplexer, 2-input multiplexers with 6dB amplifiers, and a 9-bit serial-to-parallel converter.
These ICs greatly simplify decoder switching, and can be connected to a control microprocessor using just two lines.

●Applications
Video cassette recorders

●Features
1) All the switching functions required for SECAM CANAL plus decoder integrated onto one chip.
2) Built-in 9-bit serial-to-parallel converter for decoder and TV control reduces number of microprocessor wiring connections required.
3) Inputs have a sync-tip clamp.
4) The switch section can be used independently.
5) Low power consumption off a 5V supply.

●Absolute maximum ratings (Ta = 25°C)

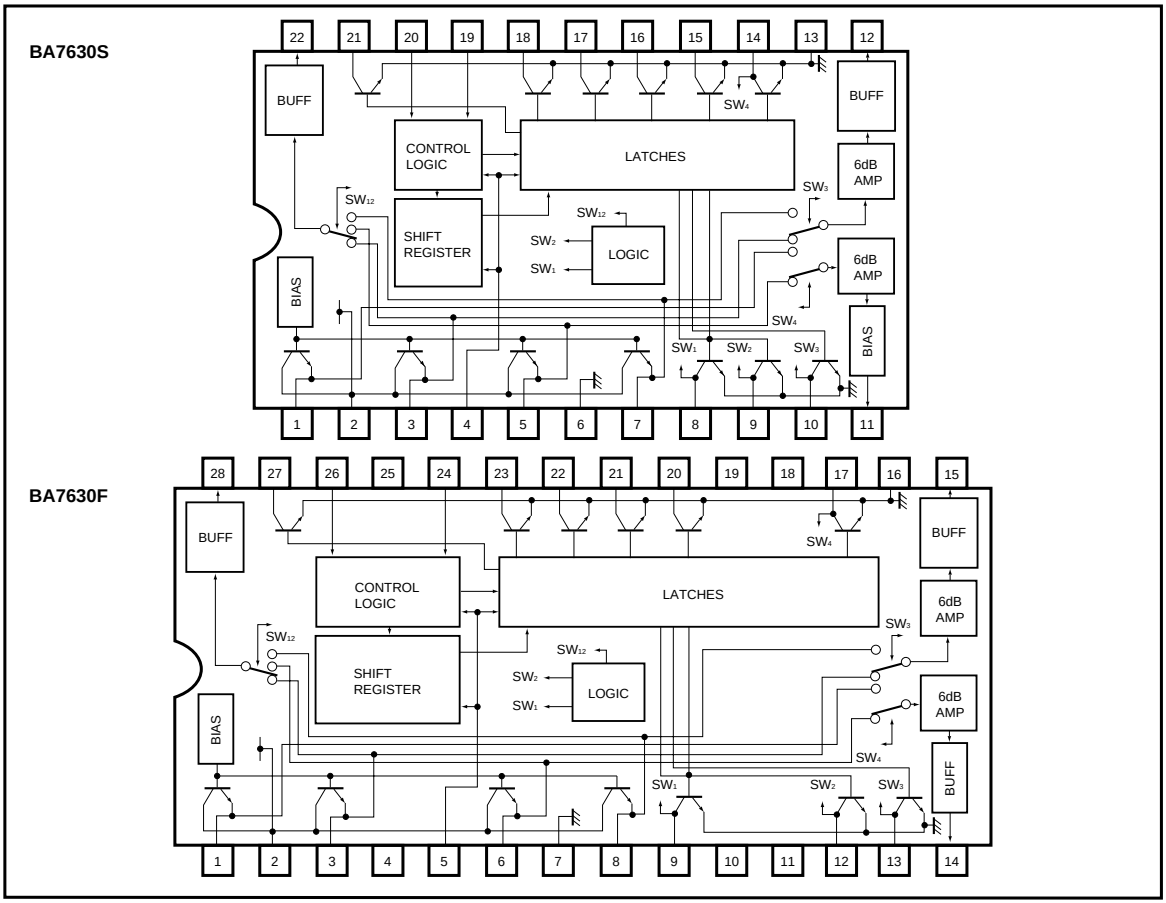
Parameter	Symbol	Limits		Unit
Power supply voltage	V_{CC}	9*1		V
Power dissipation	Pd	BA7630S	500*2	mW
		BA7630F	600*3	
Operating temperature	Topr	– 25 ~ + 70		°C
Storage temperature	Tstg	– 55 ~ + 125		°C

*1 13V for switches 1 to 9.
*2 Reduced by 5.0mW for each increase in Ta of 1°C over 25°C.
*3 Reduced by 6.0mW for each increase in Ta of 1°C over 25°C.

●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Power supply voltage	V_{CC}	4.5	5.0	5.5	V

●Block diagram



●Pin descriptions

Pin No.	Pin name	Pin No.	Pin name
1	IN 4	12 (15)	OUT 2
2	V_{CC}	13 (16)	GND
3	IN 1	14 (17)	SW 4 IN / OUT
4 (5)	RESET IN	15 (20)	SW 5 OUT
5 (6)	IN 2	16 (21)	SW 6 OUT
6 (7)	GND	17 (22)	SW 7 OUT

	G_f2-3 G_f4-3	2 1	2 2	1 2	2 2	× ×	× ×	× ×	1 2	2 2	× ×	× ×	
Interchannel crosstalk	C_{TM}1-1-2 C_{TM}1-1-3 C_{TM}2-1-1 C_{TM}2-1-3 C_{TM}3-1-1 C_{TM}3-1-2	2 2 2 2 2 2	2 2 1 2 1 2	1 2 2 2 2 1	2 1 2 1 2 2	1 1 1 1 2 2	1 1 2 2 2 2	× × × × × ×	× × × × × ×	× × × × × ×	× × × × × ×	1 1 1 1 1 1	Note 4
	C_{TM}1-2-3 C_{TM}3-2-1	2 2	2 1	2 2	1 2	× ×	× ×	1 2	× ×	× ×	1 1	× ×	
	C_{TM}2-3-4 C_{TM}4-3-2	1 2	2 2	2 1	2 2	× ×	× ×	× ×	1 2	1 1	× ×	× ×	

The measurements in the above table were made with switching voltage levels for SW_1 to SW_4 of "L" = 1V, and "H" = 3V.

Note 1: Connect distortion meters to the outputs. Adjust the input level so that the output distortion is 0.5% for a f = 1kHz sine wave input.
This output voltage is the maximum output level V_{om} (V_{P-P}).

Note 2: Input a f = 1MHz, $1V_{P-P}$ sine wave. The voltage gain G_V = 20 log V_{OUT} / V_{IN} (dB).

Note 3: Input a f = 1MHz and 10MHz, $1V_{P-P}$ sine wave. The frequency characteristic G_f = 20 log V_{OUT} (f = 10M) / V_{OUT} (f = 1M) (dB).

Note 4: Input a f = 4.43MHz, $1V_{P-P}$ sine wave.
0dB amplifier SW crosstalk is C_{TM0}, and the 6dB amplifier SW crosstalk is C_{TM6}.
C_{TM0} = 20 log V_{OUT} / V_{IN} (dB)
C_{TM6} = 20 log V_{OUT} / V_{IN} + 6 (dB)

●Circuit operation

Digital block truth table

INPUT			OUTPUT	Note
Reset	Clock	Data	SW_1 ····· SW_9

Note 5: ↓: H to L transition
Note 6: $SW_{1\text{-}O}$ to $SW_{9\text{-}O}$: SW_1 to SW_9 levels before establishing the input conditions shown in the table.
Note 7: $SW_{1\text{-}N}$ to $SW_{9\text{-}N}$
nearest clock ↓ transition.

Analog truth table

(1) OUT1 switch

SW_1	SW_2	RESET	SELECT
L	L	H	IN1
L	H	H	IN2
H	L	H	IN3
H	H	H	IN3

(2) OUT2 switch

SW_3	RESET	SELECT
L	H	IN1
H	H	IN3

(3) OUT3 switch

SW_4	RESET	SELECT
L	H	IN2
H	H	IN4

Note: When using the switches independently without the digital block, the RESET pin must be set to "H".

●Digital circuit operation

(1) Introduction

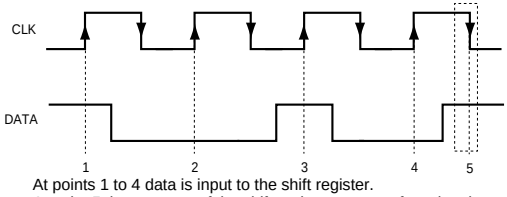
The BA7630S has 9-bit serial-to-parallel converter and latch circuit that has been included to expand the number of microprocessor output ports. The breakdown voltage of the output pins is 13V, so switch them in the range 0 to 12V. In addition to controlling the BA7630S switching block, these outputs can be used to control audio switching, scrambling decoders, and television sets.

(2) Using the serial-to-parallel convertor block

Signal input is basically done using clock and date pulses. As shown in Fig.10, the date is read on the rising edge of the clock pulses. If the date is “H” on the rising edge of the clock pulse, a “L” data bit is input to the shift register, and if the data is “L” on the rising edge of the clock pulse, a “H” data bit is input to the shift register. The shift register is sequentially incremented by the bit corresponding to SW_1. Data in excess of 9 bits is sequentially discarded.

If the data is “H” on a falling edge of the clock, the contents of the shift register are read into the internal latch, and simultaneously output to the output port (the data polarity is inverted on output). This output is maintained until the latch is setup again.

To reset, set the RESET pin to “H”. The internal shift register and latch contents go low (latch output all “H”), for the duration that RESET is held high.



At points 1 to 4 data is input to the shift register.
At point 5 the contents of the shift register are transferred to the latch and simultaneously output.
