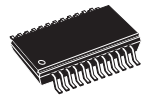
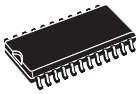
STP16DPPS05

Low voltage 16-bit constant current LED sink driver with output error detection and auto power-saving

Datasheet - production data



QSOP-24



SO-24

TSSOP24

TSSOP24 (exposed pad)

Features

- Low voltage power supply down to 3 V
- 16 constant current output channels
- Adjustable output current through external resistor
- Short and open output error detection
- Serial data IN/parallel data OUT
- Auto power-saving
- 3.3 V MCU-driving capability
- Output current: 3 to 40 mA
- 30 MHz clock frequency
- Available in high thermal efficiency TSSOP exposed pad
- ESD protection: 2 kV HBM, 200 V MM

Description

The STP16DPPS05 is a monolithic, low voltage, low current power 16-bit shift register designed for LED panel displays. The device features a 16-bit serial-in, parallel-out shift register that feeds a 16-bit D-type storage register. In the output stage, sixteen regulated current sources are designed to provide 3 to 40 mA of constant current to drive the LEDs. The STP16DPPS05 features open and short LED detection on the outputs. The detection circuit checks for 3 different conditions that can occur on the output line: short to GND, short to V_O or open line. The data detection results are loaded in the shift registers and shifted out via the serial line output. The detection functionality is implemented without increasing the pin count, through a secondary function of the output enable and latch pin (DM1 and DM2 respectively). A dedicated logic sequence allows the device to enter or exit from detection mode. The STP16DPPS05 output current can be adjusted through an external resistor to control the light intensity of the LEDs. LED brightness is adjustable from 0% to 100% via the $\overline{OE}$/DM2 pin.

The auto power-shutdown and auto power-ON feature allows the device to save power with no external intervention. The STP16DPPS05 guarantees a 20 V output driving capability, allowing users to connect more LEDs in series. The high 30 MHz clock frequency makes the device suitable for high data rate transmission. The 3.3 V supply is well suited for applications which interface a 3.3 V MCU. Compared to a standard TSSOP package, the TSSOP with exposed pad increases heat dissipation capability by a factor of 2.5

2 Electrical ratings

2.1 Absolute maximum ratings

Stressing the device above the ratings listed in the “absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other condition above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 4. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{DD}	Supply voltage	0 to 7	V
V_O	Output voltage	-0.5 to 20	V
I_O	Output current	50	mA
V_I	Input voltage	-0.4 to V_{DD}	V
I_{GND}	GND terminal current	800	mA
f_{CLK}	Clock frequency	50	MHz
T_J	Junction temperature range (1)	-40 to +170	°C

1. Such absolute value is based on the thermal shutdown protection.

Note: 1 Latch and output enable terminals are level-sensitive and are not synchronized with rising or falling edge of LE/DM1 signal.

2 When LE/DM1 terminal is low level, the latch circuit holds previous set of data.

3 When LE/DM1 terminal is high level, the latch circuit refreshes new set of data from SDI chain.

4 When $\overline{OE}$/DM2 terminal is at low level, the output terminals Out 0 to Out 15 respond to data in the latch circuits, either '1' for ON or '0' for OFF.

5 When $\overline{OE}$/DM2 terminal is at high level, all output terminals are switched OFF.

7 Error detection mode functionality

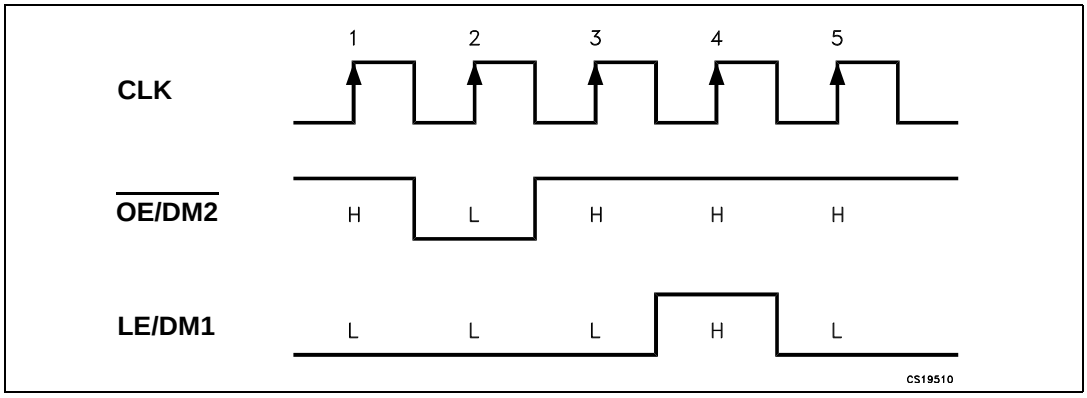
7.1 Phase one: entering error detection mode

From the “normal mode” condition the device can switch to “error mode” by a logic sequence on the *OE/DM2* and LE/DM1 pins, as shown in the following table and diagram:

Table 13. Entering error detection mode - truth table

CLK	1°	2°	3°	4°	5°
$\overline{\text{OE/DM2}}$	H	L	H	H	H
LE/DM1	L	L	L	H	L

Figure 18. Entering error detection mode - timing diagram

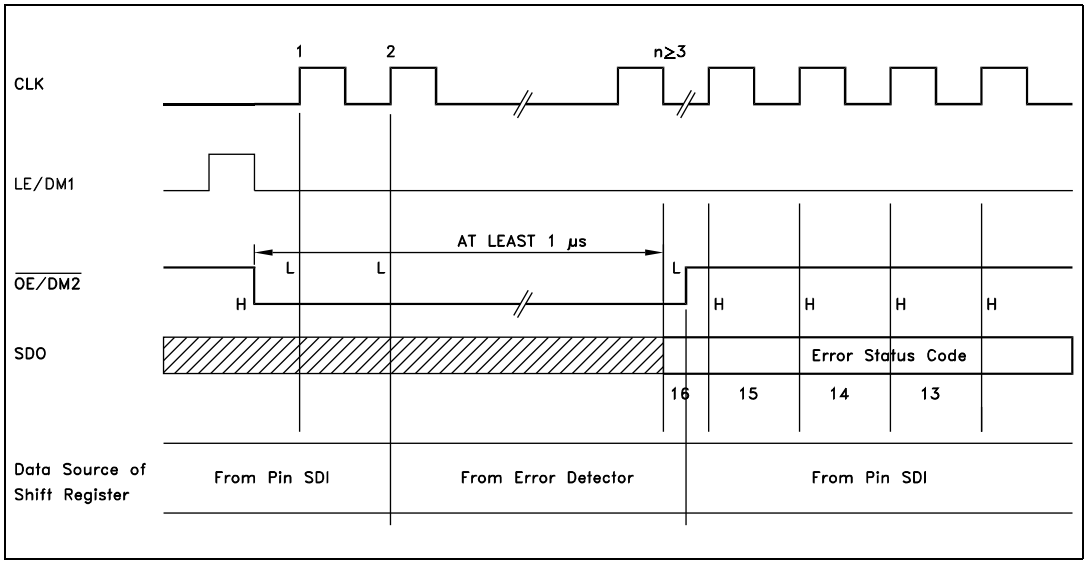


After these five CLK cycles, the device goes into “error detection mode” and at the rising edge of the 6th CLK cycle, the SDI data are ready for sampling.

7.2 Phase two: error detection

The 16 data bits must be set to “1” in order for all the outputs to be ON during error detection. The data are latched by LE/DM1, after which the outputs are ready for the detection process. When the microcontroller switches the *OE/DM2* to LOW, the device drives the LEDs to analyze if an OPEN or SHORT condition has occurred.

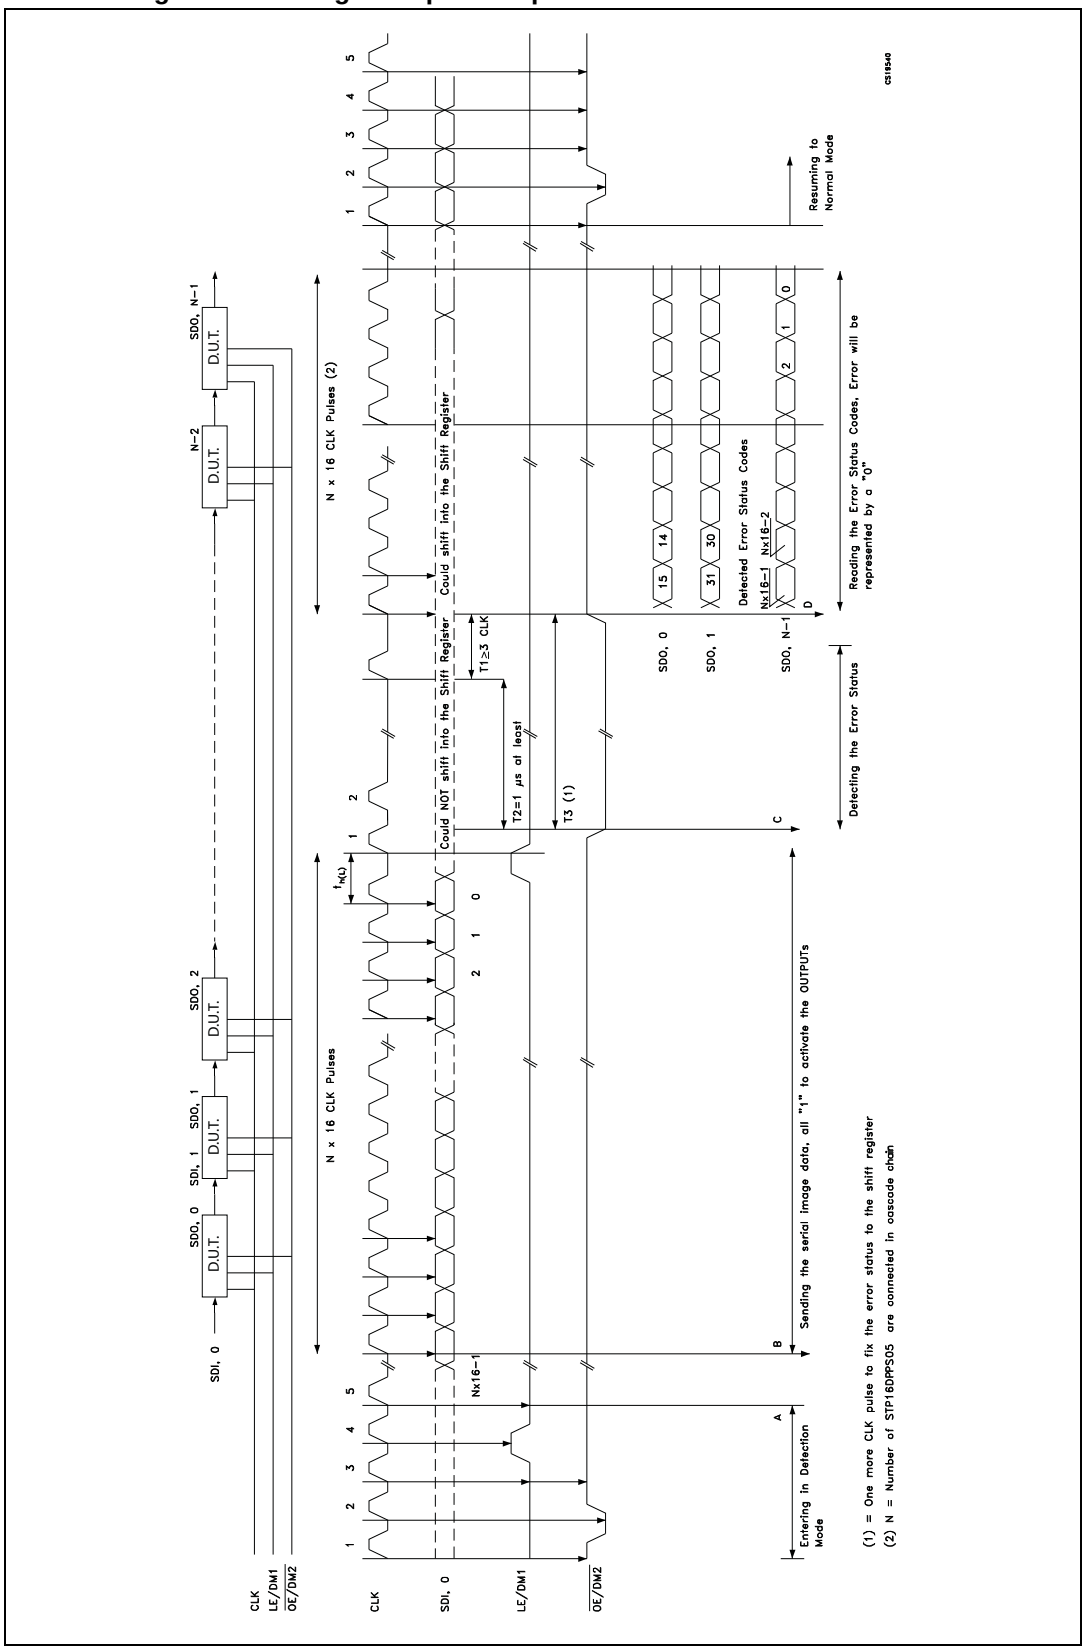
Figure 19. Detection diagram



The status of the LEDs is detected in at least 1 microsecond, and after this period the microcontroller sets *OE/DM2* to HIGH state and the output data detection result is sent to the microcontroller via SDO.

Error detection mode and normal mode both use the same data format. As soon as all the detection data bits are available on the serial line, the device may return to normal mode of operation. To re-detect the status, the device must first return to normal mode and reenter error detection mode.

Figure 20. Timing example for open and/or short-circuit detection



7.3 Phase three: resuming normal mode

The sequence for reentering normal mode is shown in the following table:

Figure 21. Resuming normal mode - timing diagram

CLK	1°	2°	3°	4°	5°
$\overline{\text{OE/DM2}}$	H	L	H	H	H
LE/DM1	L	L	L	L	L

Note: For proper device operation, the “entering error detection” sequence must be followed by a “resume mode” sequence, it is not possible to insert consecutive equal sequences.

7.4 Error detection conditions

Table 14. Detection conditions (V_{DD} = 3.3 to 5 V, temperature range -40 to 125 °C)

Configuration	Detect mode	Detection results		
SW-1 or SW-3b	Open line or output short to GND detected	==> $I_{ODEC} \leq 0.5 \times I_O$	No error detected	==> $I_{ODEC} \geq 0.5 \times I_O$
SW-2 or SW-3a	Short on LED or short to V-LED detected	==> $V_O \geq 2.6$ V	No error detected	==> $V_O \leq 2.3$ V

Note: Where: I_O = the output current programmed by the R-EXT, I_{ODEC} = the detected output current in detection mode

Figure 22. Detection circuit

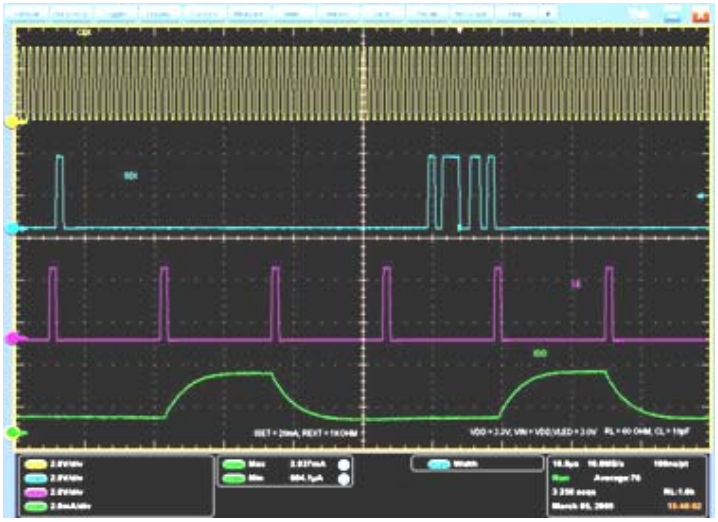
7.5 Auto power-saving

The auto power-saving feature minimizes the quiescent current if no active data is detected on the latches and auto powers-up the device as the first active data is latched.

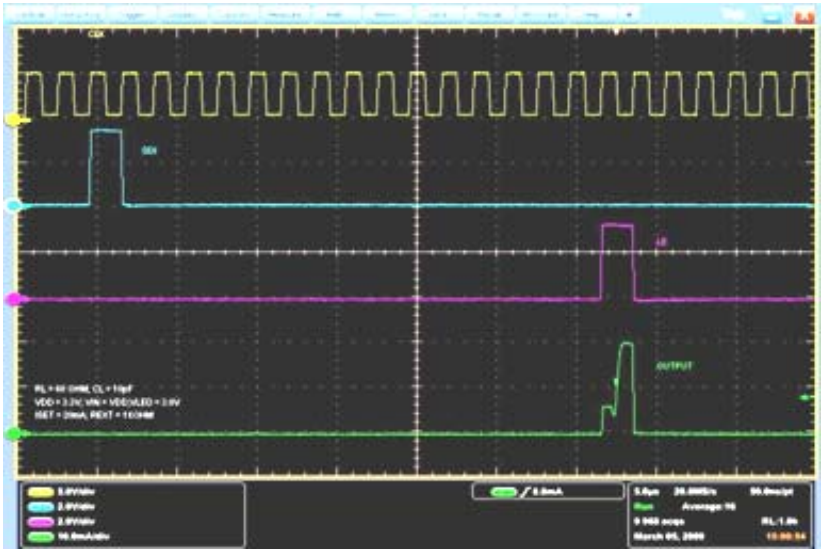
Figure 24. Auto power-saving feature



Conditions:
Temp. = 25 °C, Vdd = 3.3 V, Vin = Vdd, VLed = 3.0 V, Iset = 20 mA
Ch1 (Yellow) = CLK, Ch2 (Blue) = SDI, Ch3 (Purple) = LE/DM1, Ch4 (Green) = IDD

Idd consumption:
Idd (normal operation) = 2.93 mA
Idd (shutdown condition) = 170 µA

Figure 25. Auto power-saving feature



Conditions:
Temp. = 25°C, Vdd = 3.3 V, Vin = Vdd, VLed = 3.0 V, Iset = 20 mA
Ch1 (Yellow) = CLK, Ch2 (Blue) = SDI, Ch3 (Purple) = LE/DM1, Ch4 (Green) = IDD

Note: When the device goes from auto power-saving to normal operating condition, the first output that switches ON shows the T_{ON} condition as seen in the plot above.
