

FSTU6800A

10-Bit Bus Switch with Pre-Charged Outputs and Undershoot Protection (Preliminary)

General Description

The Fairchild Switch FSTU6800A provides 10-bits of high-speed CMOS TTL-compatible bus switching. The low on resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise. Both the A Ports and the B Ports are "undershoot hardened" to support an extended input range to 2.0V below ground. The device precharges the B Port to a selectable bias voltage (BiasV) to minimize live insertion noise.

The device is organized as a 10-bit switch with a bus enable (OE) signal. When OE is LOW, the switch is ON and Port A is connected to Port B. When OE is HIGH, the

switch is OPEN and the B Port is precharged to BiasV through an equivalent 10-k Ω resistor.

Features

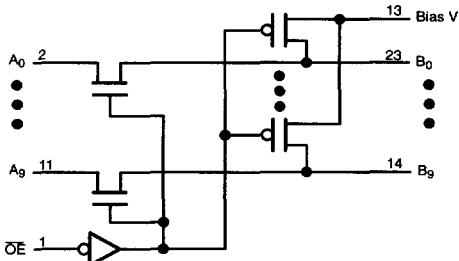

- 4 Ω switch connection between two ports.
- Undershoot Hardened to -2.0V.
- Soft enable turn-on to minimize bus-to-bus charge sharing during enable.
- Low I_{CC}.
- Zero bounce in flow-through mode.
- Output precharge to minimize live insertion noise.
- Control inputs compatible with TTL level.

Note 1: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The Recommended Operating Conditions tables will define the conditions for actual device operation.

Note 2: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed.

Note 3: Unused control inputs must be held HIGH or LOW. They may not float.
