Revision History

Revision No.	History	Draft Date	Remark	Editor
1.0	- First SPEC. Release	May. 2011	-	J.Y.Lee
1.1	- Changed timing parameters(Setup/Hold time)	Jul. 2011	-	J.Y.Lee
1.2	- Changed Input/Output Capacitance on page 23	Jan. 2012	-	J.Y.Lee
	- Corrected Typo			
1.21	- Corrected Typo (tCKmin)	Mar. 2012	-	J.Y.Lee
1.3	- Added Module line up (4GB NON ECC UDIMM)	May. 2012	-	J.Y.Lee
	- Added IDD(1866Mbps) values

- JEDEC standard 1.5V ± 0.075V Power Supply
- V_{DDQ} = 1.5V ± 0.075V
- 400MHz f_{CK} for 800Mb/sec/pin, 533MHz f_{CK} for 1066Mb/sec/pin, 667MHz f_{CK} for 1333Mb/sec/pin, 800MHz f_{CK} for 1600Mb/sec/pin, 933MHz f_{CK} for 1866Mb/sec/pin
- 8 independent internal bank
- Programmable CAS Latency: 6,7,8,9,10,11,13
- Programmable Additive Latency(Posted CAS) : 0, CL - 2, or CL - 1 clock
- Programmable CAS Write Latency(CWL) = 5 (DDR3-800), 6 (DDR3-1066), 7 (DDR3-1333), 8 (DDR3-1600) and 9 (DDR3-1866)
- Burst Length: 8 (Interleave without any limit, sequential with starting address "000" only), 4 with tCCD = 4 which does not allow seamless read or write [either On the fly using A12 or MRS]
- Bi-directional Differential Data Strobe
- On Die Termination using ODT pin
- Average Refresh Period 7.8us at lower then T_{CASE} 85°C, 3.9us at 85°C < T_{CASE} ≤ 95°C
- Asynchronous Reset

6. Pin Description

Pin Name	Description	Pin Name	Description
A0-A15	SDRAM address bus	SCL	I^2C serial bus clock for EEPROM
BA0-BA2	SDRAM bank select	SDA	I^2C serial bus data line for EEPROM
$\overline{RAS}$	SDRAM row address strobe	SA0-SA2	I^2C serial address select for EEPROM
$\overline{CAS}$	SDRAM column address strobe	V_{DD}*	SDRAM core power supply
$\overline{WE}$	SDRAM write enable	V_{DDQ}*	SDRAM I/O Driver power supply
$\overline{S0}$, $\overline{S1}$	DIMM Rank Select Lines	V_{REFDQ}	SDRAM I/O reference supply
CKE0,CKE1	SDRAM clock enable lines	V_{REFCA}	SDRAM command/address reference supply
ODT0, ODT1	On-die termination control lines	V_{SS}	Power supply return (ground)
DQ0 - DQ63	DIMM memory data bus	V_{DDSPD}	Serial EEPROM positive power supply
CB0 - CB7	DIMM ECC check bits	NC	Spare Pins(no connect)
DQS0 - DQS8	SDRAM data strobes (positive line of differential pair)	TEST	Used by memory bus analysis tools (unused on memory DIMMs)
$\overline{DQS0}$-$\overline{DQS8}$	SDRAM differential data strobes (negative line of differential pair)	$\overline{RESET}$	Set DRAMs Known State
DM0-DM8	SDRAM data masks/high data strobes (x8-based x72 DIMMs)	$\overline{EVENT}$	Reserved for optional temperature-sensing hardware
CK0, CK1	SDRAM clocks (positive line of differential pair)	V_{TT}	SDRAM I/O termination supply
$\overline{CK0}$, $\overline{CK1}$	SDRAM clocks (negative line of differential pair)	RFU	Reserved for future use

NOTE :
*The V_{DD} and V_{DDQ} pins are tied common to a single power-plane on these designs.
** DQS8, $\overline{DQS8}$, DM8 arefor ECC UDIMM only

7. SPD and Thermal Sensor for ECC UDIMMs

On DIMM thermal sensor will provide DRAM temperature readout through a integrated thermal sensor.
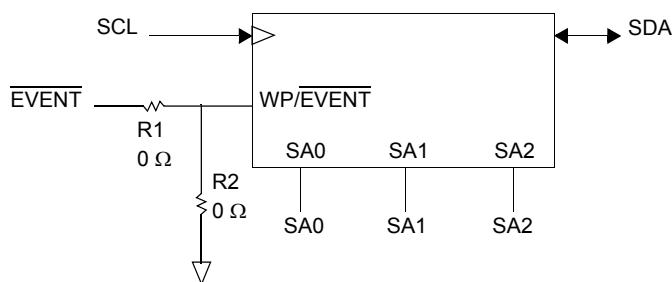

NOTE :
1. Raw Cards D (1Rx8 ECC) and E (2Rx8 ECC) support a thermal sensor.
2. When the SPD and the thermal sensor are placed on the module, R1 is placed but R2 is not.
   When only the SPD is placed on the module, R2 is placed but R1 is not.

8. Input/Output Functional Description

Symbol	Type	Function
CK0-CK1 $\overline{CK0}$-$\overline{CK1}$	SSTL	CK and $\overline{CK}$ are differential clock inputs. All the DDR3 SDRAM addr/cntl inputs are sampled on the crossing of positive edge of CK and negative edge of $\overline{CK}$. Output (read) data is reference to the crossing of CK and $\overline{CK}$ (Both directions of crossing)
CKE0-CKE1	SSTL	Activates the SDRAM CK signal when high and deactivates the CK signal when low. By deactivating the clocks, CKE low initiates the Power Down mode, or the Self-Refresh mode
$\overline{S}$0-$\overline{S}$1	SSTL	Enables the associated SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new command are ignored but previous operations continue. This signal provides for external rank selection on systems with multiple ranks.
$\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$	SSTL	$\overline{RAS}$, $\overline{CAS}$, and $\overline{WE}$ (ALONG WITH $\overline{S}$) define the command being entered.
ODT0-ODT1	SSTL	When high, termination resistance is enabled for all DQ, DQS, $\overline{DQS}$ and DM pins, assuming the function is enabled in the Extended Mode Register Set (EMRS).
V_{REFDQ}	Supply	Reference voltage for SSTL 15 I/O inputs.
V_{REFCA}	Supply	Reference voltage for SSTL 15 command/address inputs.
V_{DDQ}	Supply	Power supply for the DDR3 SDRAM output buffers to provide improved noise immunity. For all current DDR3 unbuffered DIMM designs, V_{DDQ} shares the same power plane as V_{DD} pins.
BA0-BA2	SSTL	Selects which SDRAM bank of eight is activated.
A0-A15	SSTL	During a Bank Activate command cycle, Address input defines the row address (RA0-RA13) During a Read or Write command cycle, Address input defines the column address, In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0, BA1, BA2 defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a pre-charge command cycle, AP is used in conjunction with BA0, BA1, BA2 to control which bank(s) to precharge. If AP is high, all banks will be precharged regardless of the state of BA0, BA1 or BA2. If AP is low, BA0, BA1 and BA2 are used to define which bank to precharge. A12($\overline{BC}$) is sampled during READ and WRITE commands to determine if burst chop (on-the-fly) will be performed (HIGH, no burst chop; Low, burst chopped).
DQ0-DQ63 CB0-CB7	SSTL	Data and Check Bit Input/Output pins.
DM0-DM8[1]	SSTL	DM is an input mask signal for write data. Input data is masked when DM is sampled High coincident with that input data during a write access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading.
V_{DD},V_{SS}	Supply	Power and ground for DDR3 SDRAM input buffers, and core logic. V_{DD} and V_{DDQ} pins are tied to V_{DD}/V_{DDQ} planes on these modules.
DQS0-DQS8[1] $\overline{DQS0}$-$\overline{DQS8}$[1]	SSTL	Data strobe for input and output data.
SA0-SA2	-	These signals and tied at the system planar to either V_{SS} or V_{DDSPD} to configure the serial SPD EERPOM address range.
SDA	-	This bidirectional pin is used to transfer data into or out of the SPD EEPROM. An external resistor may be connected from the SDA bus line to V_{DDSPD} to act as a pull-up on the system board.
SCL	-	This signal is used to clock data into and out of the SPD EEPROM. An external resistor may be connected from the SCL bus time to V_{DDSPD} to act as a pull-up on the system board.
V_{DDSPD}	Supply	Power supply for SPD EEPROM. This supply is separate from the V_{DD}/V_{DDQ} power plane. EEPROM supply is operable from 3.0V to 3.6V.
$\overline{RESET}$	-	The $\overline{RESET}$ pin is connected to the $\overline{RESET}$ pin on each DRAM. When low, all DRAMs are set to a know state.
$\overline{EVENT}$	Output	This signal indicates that a thermal event has been detected in the thermal sensing device. The system should guarantee the electrical level requirement is met for the $\overline{EVENT}$ pin on TS/SPD part

NOTE :
1. DM8, DQS8 and $\overline{DQS8}$ are for ECC UDIMM only

8.1 Address Mirroring Feature

There is a via grid located under the DRAMs for wiring the CA signals (address, bank address, command, and control lines) to the DRAM pins. The length of the traces from the vias to the DRAMs places limitations on the bandwidth of the module. The shorter these traces, the higher the bandwidth. To extend the bandwidth of the CA bus for DDR3 modules, a scheme was defined to reduce the length of these traces.

The pins on the DRAM are defined in a manner that allows for these short trace lengths. The CA bus pins in Columns 2 and 8, ignoring the mechanical support pins, do not have any special functions (secondary functions). This allows the most flexibility with these pins. These are address pins A3, A4, A5, A6, A7, A8 and bank address pins BA0 and BA1. Refer to Table . Rank 0 DRAM pins are wired straight, with no mismatch between the connector pin assignment and the DRAM pin assignment. Some of the Rank 1 DRAM pins are cross wired as defined in the table. Pins not listed in the table are wired straight.

Figure 1 illustrates the wiring in both the mirrored and non-mirrored case. The lengths of the traces to the DRAM pins, is obviously shorter. The via grid is smaller as well.
Figure 1. Wiring Differences for Mirrored and Non-Mirrored Addresses

Since the cross-wired pins have no secondary functions, there is no problem in normal operation. Any data written is read the same way. There are limitations however. When writing to the internal registers with a "load mode" operation, the specific address is required. See the DDR3 UDIMM SPD specification for these details. The controller must read the SPD and have the capability of de-mirroring the address when accessing the second rank. SAMSUNG DDR3 dual rank UDIMM R/C B(2Rx8) and R/C E(2Rx8) Modules are using Mirrored Addresses mode.

10. Absolute Maximum Ratings

10.1 Absolute Maximum DC Ratings

Symbol	Parameter	Rating	Units	NOTE
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	-0.4 V ~ 1.975 V	V	1,3
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	-0.4 V ~ 1.975 V	V	1,3
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	-0.4 V ~ 1.975 V	V	1
T_{STG}	Storage Temperature	-55 to +100	°C	1, 2

NOTE :
1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
3. V_{DD} and V_{DDQ} must be within 300mV of each other at all times; and V_{REF} must be not greater than 0.6 x V_{DDQ}, When V_{DD} and V_{DDQ} are less than 500mV; V_{REF} may be equal to or less than 300mV.

10.2 DRAM Component Operating Temperature Range

Symbol	Parameter	rating	Unit	NOTE
T_{OPER}	Operating Temperature Range	0 to 95	°C	1, 2, 3

NOTE :
1. Operating Temperature T_{OPER} is the case surface temperature on the center/top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between 0-85°C under all operating conditions
3. Some applications require operation of the Extended Temperature Range between 85°C and 95°C case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
   a) Refresh commands must be doubled in frequency, therefore reducing the refresh interval tREFI to 3.9us.
   b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = 0b and MR2 A7 = 1b), in this case IDD6 current can be increased around 10~20% than normal Temperature range.

12.2 V_{REF} Tolerances.

The dc-tolerance limits and ac-noise limits for the reference voltages V_{REFCA} and V_{REFDQ} are illustrate in Figure 2. It shows a valid reference voltage $V_{REF}(t)$ as a function of time. (V_{REF} stands for V_{REFCA} and V_{REFDQ} likewise).

$V_{REF}(DC)$ is the linear average of $V_{REF}(t)$ over a very long period of time (e.g. 1 sec). This average has to meet the min/max requirements of V_{REF}. Furthermore $V_{REF}(t)$ may temporarily deviate from $V_{REF}(DC)$ by no more than ± 1% V_{DD}.
Figure 2. Illustration of VREF(DC) tolerance and VREF ac-noise limits

The voltage levels for setup and hold time measurements $V_{IH}(AC)$, $V_{IH}(DC)$, $V_{IL}(AC)$ and $V_{IL}(DC)$ are dependent on V_{REF}.

"V_{REF}" shall be understood as $V_{REF}(DC)$, as defined in Figure 2.

This clarifies, that dc-variations of V_{REF} affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for $V_{REF}(DC)$ deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with V_{REF} ac-noise.
Timing and voltage effects due to ac-noise on V_{REF} up to the specified limit (+/-1% of V_{DD}) are included in DRAM timings and their associated deratings.

3. These values are not defined, however they single-ended signals CK, $\overline{CK}$, DQS, $\overline{DQS}$, DQSL need to be within the respective limits ($V_{IH}(DC)$ max, $V_{IL}(DC)$min) for single-ended signals as well as the limitations for overshoot and undershoot. 12.3.3 Single-ended Requirements for Differential Signals

Each individual component of a differential signal (CK, DQS, $\overline{CK}$, $\overline{DQS}$) has also to comply with certain requirements for single-ended signals.

CK and $\overline{CK}$ have to approximately reach V_{SEH}min / V_{SEL}max (approximately equal to the ac-levels ($V_{IH}(AC)$ / $V_{IL}(AC)$) for ADD/CMD signals) in every half-cycle.

DQS, $\overline{DQS}$ have to reach V_{SEH}min / V_{SEL}max (approximately the ac-levels ($V_{IH}(AC)$ / $V_{IL}(AC)$) for DQ signals) in every half-cycle proceeding and following a valid transition.

Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g. if $V_{IH}150(AC)/V_{IL}150(AC)$ is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and $\overline{CK}$.
Figure 4. Single-ended requirement for differential signals

Note that while ADD/CMD and DQ signal requirements are with respect to V_{REF}, the single-ended components of differential signals have a requirement with respect to $V_{DD}/2$; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach V_{SEL}max, V_{SEH}min has no bearing on timing, but adds a restriction on the common mode characteristics of these signals.

[Table 5] Single ended levels for CK, DQS, $\overline{CK}$, $\overline{DQS}$

Symbol	Parameter	DDR3-800/1066/1333/1600/1866		Unit	NOTE
		Min	Max

	Single-ended low-level for CK, $\overline{CK}$	NOTE 3	$(V_{DD}/2)-0.175$	V	1, 2

NOTE :
1. For CK, $\overline{CK}$ use $V_{IH}/V_{IL}(AC)$ of ADD/CMD; for strobes (DQS, $\overline{DQS}$) use $V_{IH}/V_{IL}(AC)$ of DQs.
2. $V_{IH}(AC)/V_{IL}(AC)$ for DQs is based on V_{REFDQ}; $V_{IH}(AC)/V_{IL}(AC)$ for ADD/CMD is based on V_{REFCA}; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here
3. These values are not defined, however the single-ended signals CK, $\overline{CK}$, DQS, $\overline{DQS}$ need to be within the respective limits ($V_{IH}(DC)$ max, $V_{IL}(DC)$min) for single-ended signals as well as the limitations for overshoot and undershoot. Refer to "Overshoot and Undershoot Specification"

12.3.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, $\overline{CK}$ and DQS, $\overline{DQS}$) must meet the requirements in below table. The differential input cross point voltage V_{IX} is measured from the actual cross point of true and complement signal to the mid level between of V_{DD} and V_{SS}.
Figure 5. V_{IX} Definition

[Table 6] Cross point voltage for differential input signals (CK, DQS)

		Min	Max		
V_{IX}	Differential Input Cross Point Voltage relative to V_{DD}/2 for CK,$\overline{CK}$	-150	150	mV	2
		-175	175	mV	1
V_{IX}	Differential Input Cross Point Voltage relative to V_{DD}/2 for DQS,$\overline{DQS}$	-150	150	mV	2

NOTE :
1. Extended range for V_{IX} is only allowed for clock and if single-ended clock input signals CK and $\overline{CK}$ are monotonic, have a single-ended swing V_{SEL} / V_{SEH} of at least V_{DD}/2 ±250 mV, and the differential slew rate of CK-$\overline{CK}$ is larger than 3 V/ ns.
2. The relation between V_{IX} Min/Max and V_{SEL}/V_{SEH} should satisfy following.
   (V_{DD}/2) + V_{IX}(Min) - V_{SEL} $\geq$ 25mV
   V_{SEH} - ((V_{DD}/2) + V_{IX}(Max)) $\geq$ 25mV

Description : SR : Slew Rate
Q : Query Output (like in DQ, which stands for Data-in, Query-Output)
se : Single-ended Signals
For Ron = RZQ/7 setting
NOTE : 1) In two cased, a maximum slew rate of 6V/ns applies for a single DQ signal within a byte lane.
- Case_1 is defined for a single DQ signal within a byte lane which is switching into a certain direction (either from high to low of low to high) while all remaining DQ signals in the same byte lane are static (i.e they stay at either high or low).
- Case_2 is defined for a single DQ signals in the same byte lane are switching into the opposite direction (i.e. from low to high or high to low respectively). For the remaining DQ signal switching into the opposite direction, the regular maximum limit of 5 V/ns applies.

13.4 Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between V_{OLdiff}(AC) and V_{OHdiff}(AC) for differential signals as shown in below.

[Table 12] Differential Output slew rate definition

Description	Measured		Defined by
	From	**To**	
Differential output slew rate for rising edge	V_{OLdiff}(AC)	V_{OHdiff}(AC)	$\dfrac{V_{OHdiff}(AC)-V_{OLdiff}(AC)}{\text{Delta TRdiff}}$
Differential output slew rate for falling edge	V_{OHdiff}(AC)	V_{OLdiff}(AC)	$\dfrac{V_{OHdiff}(AC)-V_{OLdiff}(AC)}{\text{Delta TFdiff}}$

NOTE : Output slew rate is verified by design and characterization, and may not be subject to production test.

NOTE :

1) Burst Length: BL8 fixed by MRS: set MR0 A[1,0]=00B

2) Output Buffer Enable: set MR1 A[12] = 0B; set MR1 A[5,1] = 01B; RTT_Nom enable: set MR1 A[9,6,2] = 011B; RTT_Wr enable: set MR2 A[10,9] = 10B

3) Precharge Power Down Mode: set MR0 A12=0B for Slow Exit or MR0 A12=1B for Fast Exit

4) Auto Self-Refresh (ASR): set MR2 A6 = 0B to disable or 1B to enable feature

5) Self-Refresh Temperature Range (SRT): set MR2 A7=0B for normal or 1B for extended temperature range

6) Refer to DRAM supplier data sheet and/or DIMM SPD to determine if optional features or requirements are supported by DDR3 SDRAM device

7) IDD current measure method and detail patterns are described on DDR3 component datasheet

8) VDD and VDDQ are merged on module PCB.

9) DIMM IDD SPEC is measured with Qoff condition
   (IDDQ values are not considered)

NOTE : This parameter is Component Input/Output Capacitance so that is different from Module level Capacitance.
1. Although the DM, TDQS and $\overline{TDQS}$ pins have different functions, the loading matches DQ and DQS
2. This parameter is not subject to production test. It is verified by design and characterization.
   The capacitance is measured according to JEP147("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK ANALYZER(VNA)") with V_{DD}, V_{DDQ}, V_{SS}, V_{SSQ} applied and all other pins floating (except the pin under test, CKE, $\overline{RESET}$ and ODT as necessary). $V_{DD}=V_{DDQ}$=1.5V, $V_{BIAS}=V_{DD}$/2 and on-die termination off.
3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here
4. Absolute value of CCK-$\overline{CCK}$
5. Absolute value of CIO(DQS)-CIO($\overline{DQS}$)
6. CI applies to ODT, $\overline{CS}$, CKE, A0-A15, BA0-BA2, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$.
7. CDI_CTRL applies to ODT, $\overline{CS}$ and CKE
8. CDI_CTRL=CI(CTRL)-0.5*(CI(CLK)+CI($\overline{CLK}$))
9. CDI_ADD_CMD applies to A0-A15, BA0-BA2, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$
10. CDI_ADD_CMD=CI(ADD_CMD) - 0.5*(CI($\overline{CLK}$)+CI($\overline{CLK}$))
11. CDIO=CIO(DQ,DM) - 0.5*(CIO(DQS)+CIO($\overline{DQS}$))
12. Maximum external load capacitance on ZQ pin: 5pF

17.3.1 Speed Bin Table Notes

Absolute Specification (T_{OPER}; $V_{DDQ} = V_{DD} = 1.5V$ +/- 0.075 V);

NOTE :

1. The CL setting and CWL setting result in tCK(AVG).MIN and tCK(AVG).MAX requirements. When making a selection of tCK(AVG), both need to be fulfilled: Requirements from CL setting as well as requirements from CWL setting.

2. tCK(AVG).MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (2.5, 1.875, 1.5, or 1.25 ns) when calculating CL [nCK] = tAA [ns] / tCK(AVG) [ns], rounding up to the next "SupportedCL".

3. tCK(AVG).MAX limits: Calculate tCK(AVG) = tAA.MAX / CL SELECTED and round the resulting tCK(AVG) down to the next valid speed bin (i.e. 3.3ns or 2.5ns or 1.875 ns or 1.25 ns). This result is tCK(AVG).MAX corresponding to CL SELECTED.

4. "Reserved" settings are not allowed. User must program a different value.

5. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.

6. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.

7. Any DDR3-1600 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.

8. Any DDR3-1866 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.

9. For devices supporting optional downshift to CL=7 and CL=9, tAA/tRCD/tRP min must be 13.125 ns or lower. SPD settings must be programmed to match. For example, DDR3-1333(CL9) devices supporting downshift to DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte 16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600(CL11) devices supporting downshift to DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1866(CL13) devices supporting downshift to DDR3-1600(CL11) or DDR3-1333(CL9) or DDR3-1066(CL7) should program 13.125 ns in SPD bytes for tAAmin (Byte16), tRCDmin (Byte 18), and tRPmin (Byte 20). DDR3-1600 devices supporting down binning to DDR3-1333 or DDR3-1066 should program 13.125ns in SPD byte for tAAmin (Byte 16), tRCDmin (Byte 18) and tRPmin (Byte 20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte 21,23) also should be programmed accodingly. For example, 49.125ns, (tRASmin + tRPmin = 36ns + 13.125ns) for DDR3-1333 and 48.125ns (tRASmin + tRPmin = 35ns + 13.125ns) for DDR3-1600.

10. For devices supporting optional down binning to CL=11, CL=9 and CL=7, tAA/tRCD/tRPmin must be 13.125ns. SPD setting must be programed to match. For example, DDR3-1866 devices supporting down binning to DDR3-1600 or DDR3-1333 or 1066 should program 13.125ns in SPD bytes for tAAmin(byte16), tRCDmin(Byte18) and tRPmin (byte20). Once tRP (Byte 20) is programmed to 13.125ns, tRCmin (Byte21,23) also should be programmed accordingly. For example, 47.125ns (tRASmin + tRPmin = 34ns + 13.125ns)

18.1 Jitter Notes

Specific Note a   Unit 'tCK(avg)' represents the actual tCK(avg) of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges.ex) tMRD = 4 [nCK] means; if one Mode Register Set command is registered at Tm, another Mode Register Set command may be registered at Tm+4, even if (Tm+4 - Tm) is 4 x tCK(avg) + tERR(4per),min.

Specific Note b   These parameters are measured from a command/address signal (CKE, $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK/$\overline{CK}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.

Specific Note c   These parameters are measured from a data strobe signal (DQS, $\overline{DQS}$) crossing to its respective clock signal (CK, $\overline{CK}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.

Specific Note d   These parameters are measured from a data signal (DM, DQ0, DQ1, etc.) transition edge to its respective data strobe signal (DQS, $\overline{DQS}$) crossing.

Specific Note e   For these parameters, the DDR3 SDRAM device supports tnPARAM [nCK] = RU{ tPARAM [ns] / tCK(avg) [ns] }, which is in clock cycles, assuming all input clock jitter specifications are satisfied. For example, the device will support tnRP = RU{tRP / tCK(avg)}, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which tRP = 15ns, the device will support tnRP = RU{tRP / tCK(avg)} = 6, as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at Tm+6 is valid even if (Tm+6 - Tm) is less than 15ns due to input clock jitter.

Specific Note f   When the device is operated with input clock jitter, this parameter needs to be derated by the actual tERR(mper),act of the input clock, where 2 <= m <= 12. (output deratings are relative to the SDRAM input clock.)
For example, if the measured jitter into a DDR3-800 SDRAM has tERR(mper),act,min = - 172 ps and tERR(mper),act,max = + 193 ps, then tDQSCK,min(derated) = tDQSCK,min - tERR(mper),act,max = - 400 ps - 193 ps = - 593 ps and tDQSCK,max(derated) = tDQSCK,max - tERR(mper),act,min = 400 ps + 172 ps = + 572 ps. Similarly, tLZ(DQ) for DDR3-800 derates to tLZ(DQ),min(derated) = - 800 ps - 193 ps = - 993 ps and tLZ(DQ),max(derated) = 400 ps + 172 ps = + 572 ps. (Caution on the min/max usage!)
Note that tERR(mper),act,min is the minimum measured value of tERR(nper) where 2 <= n <=
12, and tERR(mper),act,max is the maximum measured value of tERR(nper) where 2 <= n <= 12.

Specific Note g   When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per),act of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR3-800 SDRAM has tCK(avg),act = 2500 ps, tJIT(per),act,min = - 72 ps and tJIT(per),act,max = + 93 ps, then tRPRE,min(derated) = tRPRE,min + tJIT(per),act,min = 0.9 x tCK(avg),act + tJIT(per),act,min = 0.9 x 2500 ps - 72 ps = + 2178 ps. Similarly, tQH,min(derated) = tQH,min + tJIT(per),act,min = 0.38 x tCK(avg),act + tJIT(per),act,min = 0.38 x 2500 ps - 72 ps = + 878 ps. (Caution on the min/max usage!)

18.2 Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.

2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.

3. The max values are system dependent.

4. WR as programmed in mode register

5. Value must be rounded-up to next higher integer value

6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.

7. For definition of RTT turn-on time tAON see "Device Operation & Timing Diagram Datasheet"

8. For definition of RTT turn-off time tAOF see "Device Operation & Timing Diagram Datasheet".

9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.

10. WR in clock cycles as programmed in MR0

11. The maximum read postamble is bound by tDQSCK(min) plus tQSH(min) on the left side and tHZ(DQS)max on the right side. See "Device Operation & Timing Diagram Datasheet.

12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD

13. Value is only valid for RON34

14. Single ended signal parameter. Refer to chapter 8 and chapter 9 for definition and measurement method.

15. tREFI depends on T_{OPER}

16. tIS(base) and tIH(base) values are for 1V/ns CMD/ADD single-ended slew rate and 2V/ns CK, $\overline{CK}$ differential slew rate, Note for DQ and DM signals, $V_{REF}(DC) = V_{REF}DQ(DC)$. For input only pins except $\overline{RESET}$, $V_{REF}(DC)=V_{REF}CA(DC)$.
See "Address/Command Setup, Hold and Derating" on component datasheet.

17. tDS(base) and tDH(base) values are for 1V/ns DQ single-ended slew rate and 2V/ns DQS, $\overline{DQS}$ differential slew rate. Note for DQ and DM signals, $V_{REF}(DC)= V_{REF}DQ(DC)$. For input only pins except $\overline{RESET}$, $V_{REF}(DC)=V_{REF}CA(DC)$.
See "Data Setup, Hold and Slew Rate Derating" on component datasheet.

18. Start of internal write transaction is defined as follows ;
For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL

19. The maximum read preamble is bound by tLZDQS(min) on the left side and tDQSCK(max) on the right side. See "Device Operation & Timing Diagram Datasheet"

20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.

21. Although CKE is allowed to be registered LOW after a REFRESH command once tREFPDEN(min) is satisfied, there are cases where additional time such as tXPDLL(min) is also required. See "Device Operation & Timing Diagram Datasheet".

22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.

23. One ZQCS command can effectively correct a minimum of 0.5 % (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maximum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other application specific parameters.
One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$\frac{ZQCorrection}{(TSens \times Tdriftrate) + (VSens \times Vdriftrate)}$$

where TSens = max(dRTTdT, dRONdTM) and VSens = max(dRTTdV, dRONdVM) define the SDRAM temperature and voltage sensitivities.

For example, if TSens = 1.5% /°C, VSens = 0.15% / mV, Tdriftrate = 1°C / sec and Vdriftrate = 15 mV / sec, then the interval between ZQCS commands is calculated as:

$$\frac{0.5}{(1.5 \times 1) + (0.15 \times 15)} = 0.133 \approx 128ms$$

24. n = from 13 cycles to 50 cycles. This row defines 38 parameters.

25. tCH(abs) is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.

26. tCL(abs) is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.

27. The tIS(base) AC150 specifications are adjusted from the tIS(base) AC175 specification by adding an additional 125 ps for DDR3-800/1066 or 100ps for DDR3-1333/1600 of derating to accommodate for the lower alternate threshold of 150mV and another 25ps to account for the earlier reference point [(175mv - 150 mV) / 1 V/ns].

28. Pulse width of a input signal is defined as the width between the first crossing of $V_{REF}(DC)$ and the consecutive crossing of $V_{REF}(DC)$

29. tDQSL describes the instantaneous differential input low pulse width on DQS-$\overline{DQS}$, as measured from one falling edge to the next consecutive rising edge.

30. tDQSH describes the instantaneous differential input high pulse width on DQS-$\overline{DQS}$, as measured from one rising edge to the next consecutive falling edge.

31. tDQSH, act + tDQSL, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.

32. tDSH, act + tDSS, act = 1 tCK, act ; with tXYZ, act being the actual measured value of the respective timing parameter in the application.

33. The tIS(base) AC125 specifications are adjusted from the tIS(base) AC135 specification by adding an additional 75ps for DDR3-1866 to accommodate for the lower alternate threshold of 125mV and another 10ps to account for the earlier reference point [(135mv - 125mV) / 1 V/ns].
