Viewing Angle – Vertical (bottom)	AV		80	-	-	°
Viewing Angle – Horizontal (left)	AH		80	-	-	°

Lifetime		Ta=25°C, 50% checkerboard	40,000	-	-	Hrs

**Note:** Lifetime at typical temperature is based on accelerated high-temperature operation. Lifetime is tested at average 50% pixels on and is rated as Hours until **Half-Brightness**. The Display OFF command can be used to extend the lifetime of the display.

Luminance of active pixels will degrade faster than inactive pixels. Residual (burn-in) images may occur. To avoid this, every pixel should be illuminated uniformly.

## 10. OLED Controller -> MPU Interface

For detailed timing information, see datasheet: [http://www.newhavendisplay.com/app\\_notes/SSD1325.pdf](http://www.newhavendisplay.com/app_notes/SSD1325.pdf)

### 10.1. 6800-MPU Parallel Interface

The parallel interface consists of 8 bi-directional data pins, R/W, D/C, E, and /CS.

A LOW on R/W indicates write operation, and HIGH on R/W indicates read operation.

A LOW on D/C indicates "Command" read or write, and HIGH on D/C indicates "Data" read or write.

The E input serves as data latch signal, while /CS is LOW. Data is latched at the falling edge of E signal.

Function	E	R/W	/CS	D/C
Write Command	↓	0	0	0
Read Status	↓	1	0	0
Write Data	↓	0	0	1
Read Data	↓	1	0	1

### 10.2. 8080-MPU Parallel Interface

The parallel interface consists of 8 bi-directional data pins, /RD, /WR, D/C, and /CS.

A LOW on D/C indicates "Command" read or write, and HIGH on D/C indicates "Data" read or write.

A rising edge of /RS input serves as a data read latch signal while /CS is LOW.

A rising edge of /WR input serves as a data/command write latch signal while /CS is LOW.

Function	/RD	/WR	/CS	D/C
Write Command	1	↑	0	0
Read Status	↑	1	0	0
Write Data	1	↑	0	1
Read Data	↑	1	0	1

Alternatively, /RD and /WR can be kept stable while /CS serves as the data/command latch signal.

Function	/RD	/WR	/CS	D/C
Write Command	1	0	↑	0
Read Status	0	1	↑	0
Write Data	1	0	↑	1
Read Data	0	1	↑	1

### 10.3. Serial Interface

The serial interface consists of serial clock SCLK, serial data SDIN, D/C, and /CS.

D0 acts as SCLK and D1 acts as SDIN. D2 should be left open. D3~D7, E, and R/W should be connected to GND.

Function	/RD	/WR	/CS	D/C	D0
Write Command	0	0	0	0	↑
Write Data	0	0	0	1	↑

SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D7, D6,...D0.

D/C is sampled on every eighth clock and the data byte in the shift register is written to the GDRAM or command register in the same clock.

Note: Read is not available in serial mode.

## 12. Multi-Font IC -> MPU Interface

### 12.1. Serial Interface

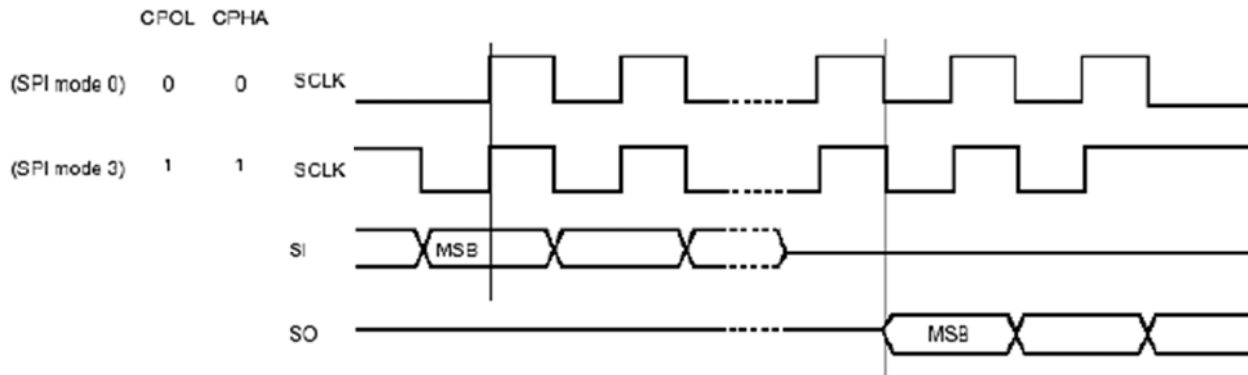

The serial interface consists of serial clock MF\_SCLK, serial data in MF\_SI, serial data out MF\_SO, chip enable /MF\_CS2.

Function	MF_SCLK	MF_SI	MF_SO	/MF_CS2
Send Font Address	↑	DATA	X	0
Read Font Data	↓	X	DATA	0

The Multi-Font device is enabled by a high-to-low transition on /MF\_CS2. /MF\_CS2 must remain LOW for the duration of any command-in or data-out sequence.

The Font Address is shifted in on the MF\_SI line on the rising edge of MF\_SCLK.

The Font Data is shifted out on the MF\_SO line on the falling edge of MF\_SCLK.

## 12.2. Communication Protocol

Font data can be accessed and read by using the READ command instruction.

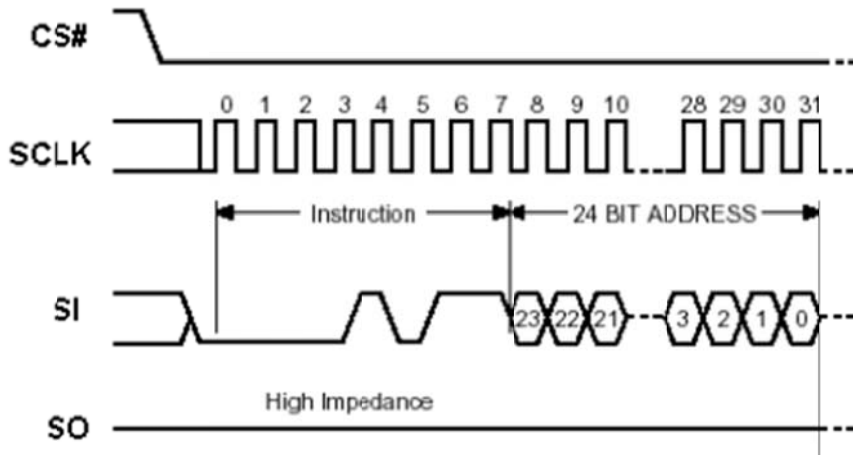

Instruction	Description	Instruction Code	Address Bytes	Dummy Bytes	Data Bytes
READ	Read Data (30MHz MAX)	0Bh	3	1	1 ~ ∞

**READ** mode supports up to 30MHz frequency on MF\_SCLK.

READ mode outputs the data starting from the specified address location. The data output stream is continuous through all addresses until terminated by a low-to-high transition on /MF\_CS2. The internal address pointer will automatically increment after each byte is read.

READ instruction is initiated by executing an 8-bit command [0x0B] on the MF\_SI line, followed by the desired font address bits [A23-A0], and followed by an 8-bit dummy write [0x00]. The font data will then be output on MF\_SO line, MSB first.

/MF\_CS2 must remain active LOW for the duration of the read cycle.
