

AN3984 Application note

IIR filter design equations for Sound Terminal[®] devices

Introduction

The purpose of this document is to provide a tool to calculate the IIR filter coefficients to program the Sound Terminal[®] devices from STMicroelectronics.

For each filter the procedure and the formulas to calculate the coefficient will be described; the Matlab code is given in *Appendix A: Matlab code (functions) on page 24*.

A generalized set of equations can be formulated for the design of first-order low-pass and high-pass filters and of second-order filters.

A specialized set of equations is devised for designing parametric biquad EQ filters. As with any other filter design procedure, the desired characteristics of the filter are to be made available.

The parameters governing the characteristics of each filter are:

- fc: filter cutoff frequency which is the -3dB corner frequency or the midpoint frequency in a peak or notch filter
- fs: sampling frequency
- Q: quality factor (not applicable for low and high-shelf filters)
- Slope: applicable only for low and high-shelf filters
- Gain: the boost or the attenuation at f = fc

These parameters can be used to determine the coefficients of the digital filter transfer function.

AN3984 Overview

1 Overview

The transfer function for a first-order filter in the digital z-domain is:

Equation 1

$$H(z) = \frac{b_0 + b_1 \cdot z^{-1}}{a_0 + a_1 \cdot z^{-1}}$$

For a second-order filter (a biquad) the transfer function is:

Equation 2

$$H(z) = \frac{b_0 + b_1 \cdot z^{-1} + b_2 \cdot z^{-2}}{a_0 + a_1 \cdot z^{-1} + a_2 \cdot z^{-2}}$$

This equation can be modified normalizing the a_0 coefficient; the new equation is:

Equation 3

$$H(z) = \frac{(b_0/a_0) + (b_1/a_0) \cdot z^{-1} + (b_2/a_0) \cdot z^{-2}}{1 + (a_1/a_0) \cdot z^{-1} + (a_2/a_0) \cdot z^{-2}}$$

The most straightforward implementation form using *Equation 3* is:

$$y[n] = (b_0/a_0) \cdot x[n] + (b_1/a_0) \cdot x[n-1] + (b_2/a_0) \cdot x[n-2] - (a_1/a_0) \cdot y[n-1] - (a_2/a_0) \cdot y[n-2]$$

Filter stability AN3984

2 Filter stability

2.1 Definition

A filter is said to be stable in the z-domain if the roots (or poles) of the filter lie inside the unit circle.

This definition of stability can be translated in terms of the filter coefficients.

2.2 First-order filter

For a first-order filter, the stability condition that needs to be satisfied is that the pole of the filter lies within the unit circle.

In terms of the coefficients, the condition can be given as:

Equation 5

$$|a_1| < 1$$

2.3 Second-order filter

For a 2nd-order filter, two conditions must be satisfied to ensure filter stability and translated in terms of the filter coefficients they are:

$$\begin{vmatrix} a_2 \end{vmatrix} < 1$$
$$\begin{vmatrix} a_1 \end{vmatrix} < (1 + a_2)$$

3 First-order filter design (LPF and HPF)

The preliminary step to obtain the coefficients for the first-order low-pass filter or high-pass filter is to define three constants obtained from the filter parameters:

Equation 7

$$\omega_c = 2 \cdot \pi \cdot f_c / f_s$$

$$K = \tan(\omega_c / 2)$$

$$\alpha = 1 + K$$

In a first-order filter both the coefficients a_2 and b_2 are null.

The denominator coefficients are identical for both an LPF and an HPF designed for the same cutoff frequency and they are computed as follows:

Equation 8

$$a_0 = 1$$

$$a_1 = -\frac{(1 - K)}{\alpha}$$

The numerator for an LPF can be calculated as follows:

Equation 9

$$b_0 = \frac{K}{\alpha}$$
$$b_1 = \frac{K}{\alpha}$$

The numerator for an HPF can be calculated as follows:

Equation 10

$$b_0 = \frac{1}{\alpha}$$

$$b_1 = -\frac{1}{\alpha}$$

The coefficient used in APWorkbench can be calculated by applying these formulas:

Coefficient
$$\frac{b_1}{2} = \frac{(b_1/2)}{a_0}$$

Coefficient $b_2 = \frac{(b_2)}{a_0}$

Coefficient $\frac{a_1}{2} = \frac{(-a_1/2)}{a_0}$

Coefficient $a_2 = \frac{-a_2}{a_0}$

Coefficient $\frac{b_0}{2} = \frac{(b_0/2)}{a_0}$

4 Second-order filter design

4.1 Low-pass and high-pass filters

The preliminary step to obtain the coefficients for a second-order filter is the calculation of these coefficients obtained from the filter parameters:

Equation 12

$$\vartheta_c = 2 \cdot \pi \cdot \frac{f_c}{f_s}$$

$$K = \tan(\omega_c/2)$$

$$W = K^2$$

$$\alpha = 1 + K$$

$$DE = 1 + \frac{K}{Q} + W$$

The denominator coefficients are the same for both an LPF and an HPF if designed for the same cutoff frequency. They are computed as follows:

Equation 13

$$a_0 = 1$$

$$a_1 = 2 \cdot \frac{(W - 1)}{DE}$$

$$a_2 = \frac{1 - \frac{K}{Q} + W}{DE}$$

4.1.1 Low-pass filter

The numerator coefficient for a second-order LPF can be calculated as follows:

$$b_0 = \frac{W}{DE}$$

$$b_1 = 2 \cdot \frac{W}{DE}$$

$$b_2 = \frac{W}{DE}$$

For a second-order LPF, the coefficients given in APWorkbench can be calculated as follows:

Equation 15

Coefficient
$$b_1/2 = \frac{W}{DE}$$

$$Coefficient \ b_2 = \frac{W}{DE}$$

$$Coefficient \ a_1/2 = -1 \cdot \frac{W-1}{DE}$$

$$Coefficient \ a_2 = -\frac{1 - \frac{K}{Q} + W}{DE}$$

$$Coefficient \ b_0/2 = \frac{1}{2} \cdot \frac{W}{DE}$$

4.1.2 High-pass filter

The numerator coefficient for a second-order HPF can be calculated as follows:

Equation 16

$$b_0 = \frac{1}{DE}$$

$$b_1 = -2 \cdot \frac{W}{DE}$$

$$b_2 = \frac{1}{DE}$$

For a second-order HPF, the coefficients given in APWorkbench can be calculated as follows:

Coefficient
$$b_1/2 = -\frac{1}{DE}$$

$$Coefficient \ b_2 = \frac{1}{DE}$$

$$Coefficient \ a_1/2 = -1 \cdot \frac{W-1}{DE}$$

$$Coefficient \ a_2 = -\frac{1 - \frac{K}{Q} + W}{DE}$$

$$Coefficient \ b_0/2 = \frac{1}{2} \cdot \frac{1}{DE}$$

4.2 Peak filters

The first step is the calculation of the constant gain obtained from the gain filter parameter (GdB is expressed in dB).

Equation 18

$$Gain = \exp(Gain_{dB} \cdot 0.115129254)$$

The filter coefficients are different if the gain is positive or negative.

4.2.1 Peak filter - negative gain (cut)

The cut value is calculated with the following equation:

Equation 19

$$CutValue = 1 + K \cdot \left(\frac{Q}{Gain}\right) + W$$

The filter coefficient can be calculated as follows:

$$a_{0} = 1$$

$$a_{1} = 4 \cdot \frac{(W-1)}{CutValue}$$

$$a_{2} = \left(\frac{1 - \frac{Q}{Gain} + W}{CutValue}\right)$$

$$b_{0} = \frac{\left(1 + \frac{K}{Q} + W\right)}{CutValue}$$

$$b_{1} = 2 \cdot \frac{(W-1)}{CutValue}$$

$$b_{2} = \frac{(1 - \frac{K}{Q} + W)}{CutValue}$$

The coefficients in the APWorkbench are consequently calculated as follows:

Equation 21

4.2.2 Peak filter - positive gain (boost)

The boost value is calculated with the following equation:

Equation 22

BoostValue =
$$1 + \frac{K}{Q} + W$$

The filter coefficient can be calculated as follows:

$$a_{0} = 1$$

$$a_{1} = \frac{(1 + K \cdot \frac{Gain}{Q} + W)}{BoostValue}$$

$$a_{2} = \frac{\left(1 - \frac{K}{Q} + W\right)}{BoostValue}$$

$$b_{0} = 2 \cdot \frac{(1 + K \cdot \frac{Gain}{Q} + W)}{BoostValue}$$

$$b_{1} = 2 \cdot \frac{W - 1}{BoostValue}$$

$$b_{2} = \frac{(1 - K \cdot \frac{Gain}{Q} + W)}{BoostValue}$$

The coefficients in the APWorkbench are consequently calculated as follows:

Equation 24

Coefficient
$$\frac{b_1}{2} = \frac{W-1}{BoostValue}$$

$$Coefficient b_2 = \frac{(1 - \frac{Gain}{Q} \cdot K + W)}{BoostValue}$$

$$Coefficient \frac{a_1}{2} = \frac{1 - W}{BoostValue}$$

$$Coefficient a_2 = -\frac{1 - \frac{K}{Q} + W}{BoostValue}$$

$$Coefficient \frac{b_0}{2} = \frac{1}{2} \cdot \frac{1 + \frac{Gain}{Q} \cdot K + W}{BoostValue}$$

4.3 Shelf filters

The coefficient gain is defined in Equation 25.

Equation 25

$$Gain = 10^{\binom{Gain_{dB}}{40}}$$

The coefficients α and β are calculated as follows:

Equation 26

$$\alpha = \frac{\sin(v_c)}{2} \cdot \sqrt{\left(\left(Gain + \left(\frac{1}{Gain}\right)\right) \cdot \left(\frac{1}{S} - 1\right) + 2\right)}$$

$$\beta = 2 \cdot \alpha \cdot \sqrt{Gain}$$

4.3.1 Low-shelf filter

The coefficients for an LSF can be calculated as follows:

Equation 27

$$\begin{aligned} a_0 &= (Gain + 1) + (Gain - 1) \cdot \cos \vartheta_c + \beta \\ a_1 &= -2 \cdot (Gain - 1) + (Gain + 1) \cdot \cos \vartheta_c \\ a_2 &= (Gain + 1) + (Gain - 1) \cdot \cos \vartheta_c - \beta \\ b_0 &= Gain \cdot ((Gain + 1) - (Gain - 1) \cdot \cos \vartheta_c + \beta) \\ b_1 &= 2 \cdot Gain \cdot ((Gain - 1) - (Gain + 1) \cdot \cos \vartheta_c) \\ b_2 &= Gain \cdot ((Gain + 1) - (Gain - 1) \cdot \cos \vartheta_c - \beta) \end{aligned}$$

The coefficient to load in APWorkbench can be calculated by applying the calculation already shown in *Equation 11*.

4.3.2 High-shelf filter

The coefficients for an HSF can be calculated as follows:

Equation 28

$$\begin{aligned} a_0 &= (Gain + 1) - (Gain - 1) \cdot \cos \vartheta_c + \beta \\ a_1 &= 2 \cdot (Gain - 1) - (Gain + 1) \cdot \cos \vartheta_c \\ a_2 &= (Gain + 1) - (Gain - 1) \cdot \cos \vartheta_c - \beta \\ b_0 &= Gain \cdot ((Gain + 1) + (Gain - 1) \cdot \cos \vartheta_c + \beta) \\ b_1 &= -2 \cdot Gain \cdot ((Gain - 1) - (Gain + 1) \cdot \cos \vartheta_c) \\ b_2 &= Gain \cdot ((Gain + 1) + (Gain - 1) \cdot \cos \vartheta_c - \beta) \end{aligned}$$

The coefficient to load in APWorkbench to program a HSF can be computed by applying the formulas shown in *Equation 11*.

4.4 Notch filter

The first step is to define the constant $\alpha^{(a)}$:

Equation 29

$$\alpha = \frac{\sin(\vartheta_c)}{2 \cdot Q}$$

The coefficients for a notch filter can be calculated as follows:

Equation 30

$$a_0 = 1 + \alpha$$

$$a_1 = -2 \cdot \cos \vartheta_c$$

$$a_2 = 1 - \alpha$$

$$b_0 = 1$$

$$b_1 = -2 \cdot \cos \vartheta$$

$$b_2 = 1$$

The coefficients to load in APWorkbench can be calculated using *Equation 11*.

a. ϑ_c is defined in *Equation 12*

4.5 All-pass filter

Equation 29 allows calculating the constant α .

The coefficients for an APF can be calculated as follows:

Equation 31

$$a_0 = 1 + \alpha$$

$$a_1 = -2 \cdot \cos \vartheta_c$$

$$a_2 = 1 - \alpha$$

$$b_0 = 1 - \alpha$$

$$b_1 = -2 \cdot \cos \vartheta_c = a_1$$

$$b_2 = 1 + \alpha$$

The coefficients to load in APWorkbench can be calculated using *Equation 11*.

4.6 Band-pass filter

Equation 29 allows calculating the constant α while *Equation 32* is used to calculate the normalized gain.

Equation 32

$$NormGain = 10^{\left(\frac{Gain_{dB}}{20}\right)}$$

The coefficients for a BPF can be calculated as follows^(b):

Equation 33

$$a_0 = 1 + \alpha$$

$$a_1 = -2 \cdot \cos \vartheta_c$$

$$a_2 = 1 - \alpha$$

$$b_0 = \alpha \cdot NormGain$$

$$b_1 = 0$$

$$b_2 = -b_0 = -\alpha \cdot NormGain$$

The coefficients to load in APWorkbench can be calculated using *Equation 11*.

b. α is defined in *Equation 29*, ϑ_{c} is defined in *Equation 12*.

Appendix B Abbreviations and acronyms

The abbreviations and acronyms used throughout this application note are defined as follows:

- fc: cutoff frequency
- fs: sampling frequency
- Q: filter quality factor
- G: gain
- LPF: low-pass filter
- HPF: high-pass filter
- LSF: low-shelf filter
- HSF: high-shelf filter
- APF: all-pass filter
- BPF: band-pass filter
