Wiring Diagrams and Dimensions. ..... 13

The Zelio-Logic relay is more than a typical relay. It will accept inputs, and has relay outputs like a programmable controller, but can not be connected to a network. Because it has timers, counters and clocks that can be programmed, this product is ideal for applications where a typical relay, timer or time clock isn't enough, but a PLC is not justified.

- The Zelio-Logic relay is designed for use in small automated systems.
- It can be used in industrial and commercial applications.
- Its small size and ease of programming provides a competitive alternative to traditional relays, timers and counters.
- Programming can be done on the relay or by using the Zelio-Soft software on your windows based computer.
- Zelio-Logic relays with four outputs will accept a 60 line program.
- Zelio-Logic Relays with eight outputs will accept a 80 line program.
- Programming in Zelio-Soft can be done in ladder logic, electrical symbols or Zelio symbols.

## Description

1. Retractable mounting feet
2. Power supply terminals
3. LCD display (4 lines, 12 characters)
4. Input terminals
5. Analog input terminals ( $0-10 \mathrm{~V}$ or 24 Vdc )
6. Delete or Cancellation button
7. Insert a new line button
8. Navigational keys or Input keys in RUN mode
9. Selection or validation button
10. Escape button
11. Slot for memory back-up EEPROM cartridge or cable connection for down loading or uploading of programs.
12. Relay output terminals
13. Marking area

## Main Zelio-Logic Screen

1. Status of inputs
2. RUN or STOP mode indication
3. Indication of a parameter (day and time is default for relays with a clock)
4. Status of outputs

The dc relays have a fast input function "FILT". This function allows faster detection of changes in state of the inputs. This mode should only be used when necessary as it makes the relay inputs more sensitive to interference and contact bounce. A "Fast" or "Slow" choice is available.

| Function |  | Electrical Scheme | Ladder Language | Zelio Relay Symbol | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Contact | N.O. SPSTNO | $\stackrel{m}{\underset{\sim}{7}}$ | $-1-$ | Ix $\triangle$ | I corresponds to the real image of the contact connected to the input of the module. |
|  | N.C. SPSTNC | $\left.\begin{array}{l} \bar{N} \\ N \end{array}\right\}$ | $-1 /-$ | Ix $\triangle$ | i (I) corresponds to the reversed image of the contact connected to the input of the module. |
| Standard Coil |  |  | $-()$ | Qx | The coil is energized when the contacts to which it is connected are closed. |
| Latch Coil (Set) |  |  | -(S)- | SQ | The coil is energized when the contacts to which it is connected are closed. <br> It remains energized when the contacts re-open. |
| Unlatch Coil (Reset) |  |  | -(R)- | RQ | The coil is de-energized when the contacts to which it is connected are closed. It remains inactive when the contacts re-open. |

A ix will work the inverse of Ix.

## Example:

Eight Time Delay Functions (provided as standard in all relays)

| Each timer function can be programmed to function in one of the following eight modes: |  |
| :---: | :---: |
|  | On-Delay |
|  | On-Delay (with momentary input) |
|  | Off-Delay |
|  | One Shot |
|  | One Shot (when input is removed) |
|  | Repeat Cycle (with maintained input) |
|  | Repeat Cycle (with momentary input) |
|  | Totalizing Timer with Reset |

Each timer function has a preset time in one of four timing ranges:

| $00.00 \mathrm{~s}(1 / 100$ of a second) | Maximum of 99.99 seconds |
| :--- | :--- |
| $000.0 \mathrm{~s}(1 / 10$ of a second) | Maximum of 999.9 seconds $(16.665$ minutes) |
| $00: 00 \mathrm{M}: \mathrm{S}$ (Minutes: Seconds) | Maximum of $99: 59$ |
| $00: 00 \mathrm{H}:$ M (Hours: Minutes) | Maximum of $99: 59$ |

The time setting on each timer can be locked. A password is required to unlock the timer.

## Eight Counters (provided as standard in all relays)

## Count up and/or count down.

Each counter function can have a preset value of 0000 to 9999.
The counter setting on each counter can be locked. A password is required to unlock the counter.
For more information on these timers and counters, refer to the User's Manual \#SR1MAN01EN.

## Some Versions Come With Four 24 Hour - 7 Day Clocks:

| ${ }^{\text {¢ }} 1$ | TU | 22 |
| :---: | :---: | :---: |
| ABCD |  | $\mathrm{MO} \rightarrow \mathrm{SA}$ |
| A | O N | 09:00 |
|  | O F F | 13 : |

On each clock you can set:

- Start Day
- End Day
- Start Time Each Day
- End Time Each Day

Example:
(Sunday or Monday)
(Friday or Saturday)
(08:30 or 9:15)
(4:57 or 5:30)

The clock settings on each clock can be locked. A password is required to unlock the counter.
Fifteen Internal Relay Functions (provided as standard in all relays)

- Each internal relay can have multiple contacts that can be used elsewhere in the program.
- Each relay can be either a standard relay, a latching relay, or an unlatching relay.
- The internal relays do not have connection points that could be used to control external loads.
- These relays give much more freedom in programming.

## Arrow Keys (4) on the Front of the Relay can be used as Inputs

- They can be used as push buttons in the program.

Some of the $\mathbf{2 4}$ Vdc Versions have Analog Inputs

- Analog inputs are only available on some 24 Vdc devices.
- They can except input values 0 through 10 V .

The following seven functions can be performed on the analog inputs:

| Type of Function | Description |
| :---: | :---: |
| Ib $\leq$ Ref <br> A1 Analoq1 Ref=4.9V | Contact A1 is closed when the value of analog input IB does not exceed the reference voltage entered in the reference field, 4.9 V in this example. |
|  | Contact A1 is closed when the value of analog input IB equals or exceeds the reference voltage entered in the reference field, 4.9 V in this example. |
| IC S Ref Al Refaloq3 R | Contact A1 is closed when the value of analog input IC does not exceed the reference voltage entered in the reference field, 4.9 V in this example. |
|  | Contact A1 is closed when the value of analog input IC equals or exceeds the reference voltage entered in the reference field, 4.9 V in this example. |
|  | Contact A1 is closed when the value of analog input IB does not exceed the value of analog input IC. |
| $\begin{array}{ccc}\text { IB } & \geq & \text { IC } \\ \text { A1 } & \text { Analoq6 }\end{array}$ | Contact A1 is closed when the value of analog input IB equals or exceeds the value of analog input IC. |
| $\left\lvert\, \begin{aligned} & I C-H \leq I B \leq I C+H \\ & D^{A 1} \quad \text { Analoq.7 } \end{aligned}\right.$ | Contact A1 is closed when the value of analog input IB is between IC-H and IC+H. H (the hysteresis) is entered in the H field, 4.9 V in this example. |

Text messages can be inputted using the Zelio-Soft software and then displayed on the relay.

## "ZELIO-SOFT": SOFTWARE

"Zelio-Soft" software enables:

- the inputting of control wiring diagrams
- the monitoring of applications, using its test feature
— the inputting of messages for display on the "Zelio-Logic"
- simplification of setting-up

## Input Modes for Control Wiring Diagrams

The "Zelio input" mode enables the user, having directly programmed the Zelio relay, to find the same ergonomics, even when using the software for the first time.

The "free input" mode, which is more intuitive, is very user friendly and incorporates several additional features.

Using Zelio-Soft in "free mode" enables the user to select their preferred symbol language from the following 3 alternatives:

- Zelio symbols
- Ladder symbols
- Electrical symbols

The "free input" mode also enables the creation of notes associated to each line of the program.
Instant switching between one input mode and another is simply obtained by clicking the mouse.

## Coherence Test and Applicable Language

The coherence test feature of Zelio-Soft monitors the applications and the slightest input error will result in it turning red. A mouse click is all that is required to locate the problem.

At any time, Zelio-Soft can be switched between 6 applicable languages (English, French, German, Italian, Portuguese and Spanish) and also, to the editing of the application file in the selected language. It enables selection of the representation mode (Zelio, Ladder or electrical) for editing the file.

## Inputting Messages for Display on Zelio-Logic

Zelio-Soft allows 4 Text function blocks to be configured, corresponding to 4 screens of 4 lines x 12 characters, which can be displayed on all the relays. These screens are activated in the same simple manner as a coil in the control scheme. It is then possible to display messages as text only or to associate them with 1 or 2 variables, the latter being current values, and/or setting of function blocks used in the program.

## Simplification of Setting-Up

The Zelio-Soft simulator enables testing of all the programs, i.e.:

- activating the discrete inputs and their N.O. or N.C. contact modes (momentary or maintained)
— indicating the output states
- varying the voltage of the analog inputs IB and IC
- activating the pushbuttons
- simulating the application program in real time and accelerated time
- dynamically indicating in red the various active elements of the program

## Environmental Characteristics

| Product Certifications |  | cULUs File E164866 <br> File E164866 <br> CSA File LR203359  <br> CE  | CCN NRAQ CNN NRAQT <br> Guide 225201 |

| Back-Up Time (3) | Day/time | $\geq 72$ hours at $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$ only applicable to SR1B••••• |  |
| Program Memory Checking |  | At each power-up |  |

(1) Characteristics at $131^{\circ} \mathrm{F}\left(55^{\circ} \mathrm{C}\right)$ for $60 \%$ loading of inputs/outputs or at $113^{\circ} \mathrm{F}\left(45^{\circ} \mathrm{C}\right)$ for $100 \%$ loading of inputs/outputs.
(2) Time between change of state of an input and the change of state of an output directly linked by the program in the same cycle.
(3) In the event of supply failure.

## OPERATING CURVES

Electrical Durability (in millions of operating cycles) (conforming to IEC 60947-5-1) *

AC-15 (5) *

(1) DC-12: switching resistive loads and photo-coupler isolated solid state loads, $\mathrm{L} / \mathrm{R} \leq 1 \mathrm{~ms}$.
(2) DC-13: switching electromagnets, $\mathrm{L} / \mathrm{R} \leq 2 \times(\mathrm{Ue} \times \mathrm{le})$ in ms , Ue: rated operational voltage, le: rated operational current (with protection diode on load, use the DC-12 curves and apply a coefficient of 0.9 to the million of operating cycles value).
(3) AC-12: switching resistive loads and photo-coupler isolated solid state loads, cos $\geq 0.9$.
(4) AC-14: switching electromagnetic loads whose power drawn with the electromagnet closed is $\leq 72$ VA, making: $\cos =0.3$, breaking: $\cos =0.3$.
(5) AC-15: switching electromagnetic loads whose power drawn with the electromagnet closed is $>72 \mathrm{VA}$, making: $\cos =0.7$, breaking: $\cos =0.4$.

* The product life expressed above is based on average usage and normal operating conditions. Actual operating life will vary with conditions. The above statements are not intended to, nor shall they create any expressed or implied warranties as to product operation or life. For information on the listed warranty offered on this product, refer to the Square D terms and conditions of sale found in the Square D Digest.
