TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

TC74HCT174AP, TC74HCT174AF, TC74HCT174AFN

HEX D-TYPE FLIP FLOP WITH CLEAR

(Note) The JEDEC SOP (FN) is not available in Japan.

The TC74HCT174A is a high speed CMOS D-TYPE FLIP FLOP fabricated with silicon gate C^2MOS technology.
It achieves the high speed operation similar to equivalent LSTTL while maintaining the CMOS low power dissipation.
This device may be used as a level converter for interfacing TTL or NMOS to High Speed CMOS. The inputs are compatible with TTL, NMOS and CMOS output voltage levels.
Information signals applied to the D inputs are transferred to the Q outputs on the positive going edge of the clock pulse.
When the $\overline{CLR}$ input is held low, the Q outputs are in the low logic level independent of the other inputs.
All inputs are equipped with protection circuits against static discharge or transient excess voltage.

Note (1) C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation :

$$I_{CC}(opr) = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC} / 6 \text{ (per F / F)}$$

And the total C_{PD} when n pcs. of Flip Flop operate can be gained by the following equation :

$$C_{PD}(total) = 18 + 12 \cdot n$$
