# STK672-210-E

---

Thick-Film Hybrid IC

## Unipolar Constant-Current Chopper Two-Phase Stepping Motor Driver Output Current 1.4A

### Overview

The STK672-210-E is two-phase stepping motor driver hybrid IC (HIC) that features further miniaturization and improved input logic flexibility as compared to the STK6712 series products.

### Applications

- The STK672-210-E is optimal for use as a stepping motor driver in printers, copiers, XY plotters, and similar equipment.

### Features

- Built-in common-mode input protection circuit.
- The input signal logic lines are provided as active-high and active-low pairs, and thus support switching the motor wiring.
- Built-in current detection resistor for reduced external component mounting area on the printed circuit board.
- Wide motor operating range (10 to 45V)

# STK672-210-E

## Specifications

### Absolute Maximum Ratings at $T_c = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage 1	$V_{CC1 \text{ max}}$	No signal	52	V
Maximum supply voltage 2	$V_{CC2 \text{ max}}$	No signal	-0.3 to +7.0	V
Input voltage	$V_{IN \text{ max}}$	Logic input pins	-0.3 to +7.0	V
Output current	$I_{OH \text{ max}}$	0.5s, 1 pulse, when $V_{CC1}$ is applied	2.2	A
Allowable power dissipation	$P_d \text{ max}$	With an arbitrarily large heat sink. Per MOSFET	6.5	W
Operating substrate temperature	$T_c \text{ max}$		105	$^\circ\text{C}$
Junction temperature	$T_j \text{ max}$		150	$^\circ\text{C}$
Storage temperature	$T_{stg}$		-40 to +125	$^\circ\text{C}$

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

### Allowable Operating Ranges at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage 1	$V_{CC1}$	With signals applied	10 to 45	V
Supply voltage 2	$V_{CC2}$	With signals applied	$5.0 \pm 5\%$	V
Input voltage	$V_{IH}$		0 to $V_{CC2}$	V
Phase driver withstand voltage	$V_{DSS}$	$I_D = 1\text{mA}$ ( $T_c = 25^\circ\text{C}$ )	100	V
Output current 1	$I_{OH1}$	When the pin 6 to 9 signals are $\geq 100\text{Hz}$ , $T_c = 105^\circ\text{C}$ , 50% duty	1.4	A
Output current 2	$I_{OH2}$	When the pin 6 to 9 signals are $\geq 100\text{Hz}$ , $T_c = 90^\circ\text{C}$ , 50% duty	1.6	A

### Electrical Characteristics at $T_c = 25^\circ\text{C}$ , $V_{CC1} = 24\text{V}$ , $V_{CC2} = 5\text{V}$

Parameters	Symbols	Conditions	Rating			unit
			min	typ	max	
Control supply current	$I_{CCO}$	With all inputs at the $V_{CC2}$ level		3.3	10	mA
Output average current	$I_{oave}$	With $R/L = 3.5\Omega/3.8\text{mH}$ in each phase	0.405	0.450	0.505	A
FET diode forward voltage	$V_{df}$	$I_f = 1.0\text{A}$		1.1	1.8	V
Output saturation voltage	$V_{sat}$	$R_L = 24\Omega$		0.8	1.2	V
Vref input voltage	$V_{rH}$	Pin 12	0		3.5	V
Vref input bias current	$I_{IB}$	With pin 12 at 1V		50	500	nA
[Control Input Pins]						
Input voltage	$V_{IH}$	HIC pins 6 to 9	3.5			V
	$V_{IL}$	HIC pins 6 to 9			0.7	V
Input current	$I_{IH}$	HIC pins 6 to 9, $V_{IN} = V_{CC2}$		310		$\mu\text{A}$
	$I_{IL}$	HIC pins 6 to 9, $V_{IN} = 0\text{V}$		2.5		$\mu\text{A}$

Note: A fixed-voltage power supply must be used.

## Package Dimensions

unit:mm (typ)

4168

### Setting the Motor Current Peak Value (I<sub>OH</sub>)

$$I_{OH} \approx V_{ref} \div R_s$$

V<sub>ref</sub>: STK672-210-E pin 12 input voltage

R<sub>s</sub>: STK672-210-E internal current detection resistor (0.195Ω ±2%)

Model of the Motor Current Flowing into the Driver IC (pins 2, 3, 4, and 5)

$$V_{ref} = (R_{o2} \div (R_{o1} + R_{o2})) \times V_{CC2}$$

$$V_{CC2} = 5V$$

### Current Switching Techniques

Due to the input bias current (I<sub>IB</sub>) specifications, R<sub>o1</sub> must be under 100kΩ.

The figures below present sample circuits that temporarily switch the motor current when, for example a held motor stops.

We recommend using the circuit structure in the figure at the left to minimize as much as possible the effects of the saturation voltage of the reference voltage switching transistor.

Switching Circuit 1

Switching Circuit 2

### Input Pin Circuits

Input pin	Circuit type
Pin 6, 7, 8, and 9	
Pin 12	

**Thermal Design**

The size of the heat sink required for the STK672-210-E depends on the output current  $I_{OH}$  (A), the electrical characteristics of the motor, the excitation mode, and the basic drive frequency.

The thermal resistance ( $\theta_{c-a}$ ) of the required heat sink can be determined from the following formula.

$$\theta_{c-a} = \frac{T_{c\ max} - T_a}{P_d} \text{ (}^\circ\text{C/W)}$$

$T_{c\ max}$ : The STK672-210-E substrate temperature ( $^\circ\text{C}$ )

$T_a$ : The STK672-210-E ambient temperature ( $^\circ\text{C}$ )

$P_d$ : The average internal power dissipation in the STK672-210-E (W)

For example, the required area for a heat sink made from 2mm thick aluminum can be determined from the graph at the right below. Note that the ambient temperature is greatly influenced by the ventilation and air flow patterns within the application. This means that the size of the heat sink must be determined with care so that the STK672-210-E back surface (aluminum substrate) temperature  $T_c$  in the mounted state never exceeds, under any conditions that might occur, the temperature  $T_c = 105^\circ\text{C}$ .

**STK672-210-E Average Internal Power Dissipation  $P_d$**

Of the devices that contribute to the STK672-210-E average internal power supply, the devices with the largest power dissipation are the current control devices, the diodes that handle the regenerative current, the current detection resistor, and the predriver circuit.

The following presents formulas for calculating the power dissipation for the different excitation (drive) modes.

2 phase excitation mode

$$P_{d2EX} = (V_{sat} + V_{df}) \times 0.5 \times \text{CLOCK} \times I_{OH} \times t_2 + 0.5 \times \text{CLOCK} \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)$$

1-2 phase excitation mode

$$P_{d1-2EX} = (V_{sat} + V_{df}) \times 0.25 \times \text{CLOCK} \times I_{OH} \times t_2 + 0.25 \times \text{CLOCK} \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)$$

Motor hold mode

$$P_{dHOLDEX} = (V_{sat} + V_{df}) \times I_{OH}$$

$V_{sat}$ : Ron voltage drop + shunt resistor combined voltage

$V_{df}$ : FET internal diode + shunt resistor combined voltage

CLOCK: Input clock (shows clock in the timing charts on page 4)

Figure 1 Motor COM current waveform model

# STK672-210-E

t1: The time until the winding current reaches its rated current ( $I_{OH}$ )

t2: The time in the constant-current control (PWM) region

t3: The time from the point a phase signal is cut until the back EMF current is dissipated.

$$t1 = (-L/(R + 0.77)) \ln (1 - ((R + 0.77)/V_{CC1}) \times I_{OH})$$

$$t3 = (-L/R) \ln ((V_{CC1} + 0.77) / (I_{OH} \times R + V_{CC1} + 0.77))$$

$V_{CC1}$ : Motor supply voltage (V)

L: Motor inductance (H)

R: Motor winding resistance ( $\Omega$ )

$I_{OH}$ : Set motor output current wave height (A)

The constant-current control time t2, and the time T (= t1 + t2 + t3) that the phase signal is on in each excitation mode are as follows.

2 phase excitation mode:  $t2 = (2/\text{Clock}) - (t1 + t3)$

1-2 phase excitation mode:  $t2 = (3/\text{Clock}) - t1$

Determine the values for  $V_{sat}$  and  $V_{df}$  by substitution using the graphs for  $V_{sat}$  vs  $I_{OH}$  and  $V_{df}$  vs  $I_{OH}$  for the set current value for  $I_{OH}$ . Then judge whether or not a heat sink is required from the determined average power dissipation for the STK672-210-E by comparison with the  $\Delta T_c$  vs. Pd graph.

Note that it is necessary to check the temperature rise in the actual application system case, since the STK672-210-E substrate temperature  $T_c$  changes with the air convection conditions around the STK672-210-E when a heat sink without fins is used.

# STK672-210-E

## STK672-210-E Allowable Avalanche Energy Value

### [Allowable Range in Avalanche Mode]

When driving a 2-phase stepping motor with constant current chopping using an STK672-2\*\* Series hybrid IC, the waveforms shown in Figure 1 below result for the output current,  $I_D$ , and voltage,  $V_{DS}$ .

Figure 1 Output Current,  $I_D$ , and Voltage,  $V_{DS}$ , Waveforms 1 of the STK672-2\*\* Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

## STK672-210-E

When operations of the MOSFET built into STK672-2\*\* Series ICs is turned off for constant current chopping, the  $I_D$  signal falls like the waveform shown in the figure above. At this time, the output voltage,  $V_{DS}$ , suddenly rises due to electromagnetic induction generated by the motor coil.

In the case of voltage that rises suddenly, voltage is restricted by the MOSFET  $V_{DSS}$ . Voltage restriction by  $V_{DSS}$  results in a MOSFET avalanche. During avalanche operations,  $I_D$  flows and the instantaneous energy at this time,  $E_{AVL1}$ , is represented by Equation (1).

$$E_{AVL1} = V_{DSS} \times I_{AVL} \times 0.5 \times t_{AVL} \text{ ----- (1)}$$

$V_{DSS}$ : V units,  $I_{AVL}$ : A units,  $t_{AVL}$ : sec units

The coefficient 0.5 in Equation (1) is a constant required to convert the  $I_{AVL}$  triangle wave to a square wave.

During STK672-2\*\* Series operations, the waveforms in the figure above repeat due to the constant current chopping operation. The allowable avalanche energy,  $E_{AVL}$ , is therefore represented by Equation (2) used to find the average power loss,  $P_{AVL}$ , during avalanche mode multiplied by the chopping frequency in Equation (1).

$$P_{AVL} = V_{DSS} \times I_{AVL} \times 0.5 \times t_{AVL} \times f_c \text{ ----- (2)}$$

$f_c$ : Hz units ( $f_c$  is set to the PWM frequency of 50kHz.)

For  $V_{DSS}$ ,  $I_{AVL}$ , and  $t_{AVL}$ , be sure to actually operate the STK672-2\*\* Series and substitute values when operations are observed using an oscilloscope.

Ex. If  $V_{DSS}=110V$ ,  $I_{AVL}=1A$ ,  $t_{AVL}=0.2\mu s$  when using a STK672-210-E driver, the result is:

$$P_{AVL} = 110 \times 1 \times 0.5 \times 0.2 \times 10^{-6} \times 50 \times 10^3 = 0.55W$$

$V_{DSS}=110V$  is a value actually measured using an oscilloscope.

The allowable loss range for the allowable avalanche energy value,  $P_{AVL}$ , is shown in the graph in Figure 3. When examining the avalanche energy, be sure to actually drive a motor and observe the  $I_D$ ,  $V_{DSS}$ , and  $t_{AVL}$  waveforms during operation, and then check that the result of calculating Equation (2) falls within the allowable range for avalanche operations.

### [ $I_D$ and $V_{DSS}$ Operating Waveforms in Non-avalanche Mode]

Although the waveforms during avalanche mode are given in Figure 1, sometimes an avalanche does not result during actual operations.

Factors causing avalanche are listed below.

- Poor coupling of the motor's phase coils (electromagnetic coupling of A phase and AB phase, B phase and BB phase).
- Increase in the lead inductance of the harness caused by the circuit pattern of the P.C. board and motor.
- Increases in  $V_{DSS}$ ,  $t_{AVL}$ , and  $I_{AVL}$  in Figure 1 due to an increase in the supply voltage from 24V to 36V.

If the factors above are negligible, the waveforms shown in Figure 1 become waveforms without avalanche as shown in Figure 2.

Under operations shown in Figure 2, avalanche does not occur and there is no need to consider the allowable loss range of  $P_{AVL}$  shown in Figure 3.

Figure 2 Output Current,  $I_D$ , and Voltage,  $V_{DS}$ , Waveforms 2 of the STK672-2\*\* Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

## STK672-210-E

Figure 3 Allowable Loss Range, PAVL-I<sub>OH</sub> During STK672-210-E Avalanche Operations

**Note:**

The operating conditions given above represent a loss when driving a 2-phase stepping motor with constant current chopping.

Because it is possible to apply 2W or more at I<sub>OH</sub>=0A, be sure to avoid using the MOSFET body diode that is used to drive the motor as a zener diode.

**[Smoke Emission Precautions]**

If any of the output pins 2, 3, 4, and 5 is held open, the electrical stress onto the driver due to the inductive energy accumulated in the motor could cause short-circuit followed by permanent damage to the internal MOSFET.

As a result, the STK672-210-E may give rise to emit smoke.
