# Constant Voltage / Constant Current Secondary-Side Controller

# Description

The NCS1002A is a performance upgrade from the NCS1002 focused on reducing power consumption in applications that require more efficient operation. It is a highly integrated solution for Switching Mode Power Supply (SMPS) applications requiring a dual control loop to perform Constant Voltage (CV) and Constant Current (CC) regulation. The NCS1002A integrates a 2.5 V voltage reference and two precision op amps. The voltage reference, along with Op Amp 1, is the core of the voltage control-loop. Op Amp 2 is an independent, uncommitted amplifier specifically designed for the current control. Key external components needed to complete the two control loops are: (a) A resistor divider that senses the output of the power supply (battery charger) and fixes the voltage regulation set point at the specified value. (b) A sense resistor that feeds the current sensing circuit with a voltage proportional to the DC output current. This resistor determines the current regulation set point and must be adequately rated in terms of power dissipation. The NCS1002A comes in a small 8-pin SOIC package and is ideal for space-shrunk applications such as battery chargers.

#### **Features**

- Low Input Offset Voltage: 0.5 mV, Typ
- Input Common-Mode Range includes Ground
- Low Quiescent Current: 150  $\mu$ A per Op Amp at  $V_{CC} = 5 \text{ V}$
- Large Output Voltage Swing
- Wide Power Supply Range: 3 V to 32 V
- High ESD Protection: 2 kV
- These are Pb-Free Devices

#### **Typical Applications**

- Battery Chargers
- Switch Mode Power Supplies

The input common–mode voltage of either input signal should not be allowed to go negative by more than 0.3 V. The upper end of the common–mode range is V<sub>CC</sub> – 1.5 V. Both inputs can go to V<sub>CC</sub> + 0.3 V without damage.
The Dynamic Impedance is defined as I ZKA I = ΔV<sub>KA</sub> / ΔI<sub>K</sub>.
