Description

The PT7M61xx series of ultra-low-power voltage detectors monitor battery, power-supply and system voltages. Each circuit includes a precision bandgap reference, a comparator, internally trimmed resistor networks that set specified trip thresholds, and an internal 1% and 5% threshold hysteresis circuit. Output is asserted when V_{CC} falls below the internal V_{TH-} and remains asserted until V_{CC} rises above V_{TH+} ($V_{TH+} = V_{TH-} \times 1.05$). These devices provide excellent circuit reliability and low cost by eliminating external components and adjustments when monitoring nominal system voltages from +1.8V to +5V in 100mV increments. The series are voltage detectors with a propagation delay of 17 μs .

The family is available with three output stage options: push-pull with active-low output, push-pull with active-high output, and open drain with active-low output. These devices specified over the -40 °C to +85 °C temperature range.

PT7M61xxNL Application Example

Please use N-ch open drains configuration, when a resistor R_{IN} is connected between the V_{CC} pin and power source V_{IN} . In such cases, please ensure that R_{IN} is less than $10\text{k}\Omega$ and that C is more than $0.1\mu\text{F}$. R_L could be $1\text{k}\Omega$ to $510\text{k}\Omega$.
