DESCRIPTION

The UT54ACS165 and the UT54ACTS165 are 8-bit serial shift registers that, when clocked, shift the data toward serial output Q_H . Parallel access to each stage is provided by eight individual data inputs that are enabled by a low level at the $\overline{SH/LD}$ input. The devices feature a clock inhibit function and a complemented serial output \overline{Q}_H .

Clocking is accomplished by a low-to-high transition of the CLK input while $\overline{SH/LD}$ is held high and CLK INH is held low. The functions of the CLK and CLK INH (clock inhibit) inputs are interchangeable. Since a low CLK input and a low-to-high transition of CLK INH will also accomplish clocking, CLK INH should be changed to the high level only while the CLK input is high. Parallel loading is disabled when $\overline{SH/LD}$ is held high. Parallel inputs to the registers are enabled while $\overline{SH/LD}$ is low independently of the levels of CLK, CLK INH or SER inputs.

The devices are characterized over full military temperature range of -55°C to +125°C.
