# NOCAP™ LongPlay Headphone Amplifier

NCP2817 is a dual LongPlay true ground headphone amplifier designed for portable communication device applications such as mobile phones. This part is capable of delivering typical 27 mW of continuous average power into a 32  $\Omega$  load from a 1.8 V power supply with a THD+N of 1%.

Based on the power supply delivered to the device, an internal power management block generates a symmetrical positive and negative voltage. Thus, the internal amplifiers provide outputs referenced to Ground and the losses are reduced which helps to increase the battery life. In this NOCAP configuration, the two external heavy coupling capacitors can be removed. It offers significant space and cost savings compared to a typical stereo application.

NCP2817 is available with internal gain of -1.5 V/V. It reaches a superior -100 dB PSRR and noise floor. Thus, it offers high fidelity audio sound, as well as a direct connection to the battery. It contains circuitry to prevent from "Pop & Click" noise that would otherwise occur during turn-on and turn-off transitions. The device is available in 12 bump CSP package (1.62 x 1.22, 0.4P) which helps to save space on the board.

#### **Features**

- NOCAP Output Eliminates DC-Blocking Capacitors:
  - · Saves Board Area
  - Saves Component Cost
  - No Low-Frequency Response Attenuation
- LongPlay Architecture: Increase the Battery Life
- High PSRR (-100 dB): Direct Connection to the Battery
- High SNR Performance (100 dB)
- "Pop and Click" Noise Protection Circuitry
- Internal Gain (-1.5 V/V) or External Adjustable Gain
- Ultra Low Current Shutdown Mode
- High Impedance Mode
- 1.6 V 5.5 V Operation
- Thermal Overload Protection Circuitry
- CSP 1.62 x 1.22, 0.4P
- These Devices are Pb–Free, Halogen Free/BFR Free and are RoHS Compliant

#### **Typical Applications**

- Headset Audio Amplifier for
  - Cellular Phones
  - MP3 player
  - Personal Digital Assistant and Portable Media Player
  - · Portable devices

#### ORDERING INFORMATION

See detailed ordering and shipping information on page 9 of this data sheet.

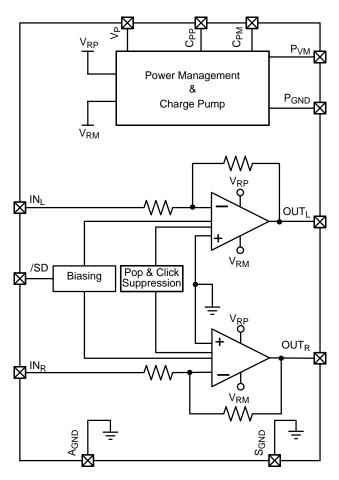

Figure 1. Block Diagram

### PIN FUNCTION DESCRIPTION

Pin	Pin Name	Туре	Description
A1	C <sub>PM</sub>	Input / Output	Charge pump flying capacitor negative terminal. A 1 μF ceramic capacitor to C <sub>PP</sub> is required
A2	$P_{VM}$	Output	Charge pump output. A 1 μF ceramic capacitor to ground is needed
А3	INL	Input	Left input of the audio source
A4	IN <sub>R</sub>	Input	Right input of the audio source
B1	$P_{GND}$	Ground	Power ground. This pin should be connected directly to the ground plane.
B2	/SD	Input	Enable activation.
B4	S <sub>GND</sub>	Ground	Sense Ground. Connect to shield terminal of headphone jack or ground plane.
C1	C <sub>PP</sub>	Input / Output	Charge pump flying capacitor positive terminal. A 1 $\mu F$ ceramic capacitor to $C_{PM}$ is required
C2	V <sub>P</sub>	Power	Positive supply voltage. Connected to single secondary cell Lithium–Ion battery or any other kind of power supply
C3	OUT <sub>L</sub>	Output	Left audio channel output signal
C4	OUT <sub>R</sub>	Output	Right audio channel output signal
В3	A <sub>GND</sub>	Ground	Analog ground. This pin should be connected directly to the GND plane. Careful layout and no direct connection to other ground pins are required to ensure good noise immunity

#### **MAXIMUM RATINGS**

Rating	Symbol	Value	Unit
V <sub>P</sub> Pin: Power Supply Voltage (Note 1)	V <sub>P</sub>	-0.3 to + 6.0	V
/SD Pin: Input	V <sub>mr1</sub>	$-0.3$ to $V_P + 0.3$	V
Human Body Model (HBM) ESD Rating are (Notes 2 and 3)	ESD HBM	2000	V
Machine Model (MM) ESD Rating are (Note 2 and 3)	ESD MM	200	V
CSP 1.62 x 1.22, 0.4P package (Note 6 and 7) Thermal Resistance Junction to Case	$R_{ heta JC}$	(Note 7)	°C/W
Operating Ambient Temperature Range	T <sub>A</sub>	-40 to + 85	°C
Operating Junction Temperature Range	T <sub>J</sub>	-40 to + 125	°C
Maximum Junction Temperature (Note 6)	T <sub>JMAX</sub>	+ 150	°C
Storage Temperature Range	T <sub>STG</sub>	-65 to + 150	°C
Moisture Sensitivity (Note 5)	MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- 1. Maximum electrical ratings are defined as those values beyond which damage to the device may occur at T<sub>A</sub> = 25°C.
- 2. According to JEDEC standard JESD22-A108B.
- 3. This device series contains ESD protection and passes the following tests: Human Body Model (HBM) ±2.0 kV per JEDEC standard: JESD22-A114 for all pins. Machine Model (MM) ±200 V per JEDEC standard: JESD22-A115 for all pins.
- 4. Latch up Current Maximum Rating: ±100 mA per JEDEC standard: JESD78 class II.
- 5. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.
   6. The thermal shutdown set to 150 °C (typical) avoids irreversible damage on the device due to power dissipation.
- The R<sub>θCA</sub> is dependent on the PCB heat dissipation. The maximum power dissipation (P<sub>D</sub>) is dependent on the min input voltage, the max output current and external components selected.

$$R_{\theta CA} = \frac{125 - T_A}{P_D} - R_{\theta JC}$$

ELECTRICAL CHARACTERISTICS Min & Max Limits apply for T<sub>A</sub> between -40°C to +85°C and T<sub>J</sub> up to + 125°C for V<sub>P</sub> = 3.6 V (Unless otherwise noted). Typical values are referenced to  $T_A = +25^{\circ}C$  and  $V_P = 3.6$  V.

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
V <sub>BATTERY</sub>	Supply voltage range		1.6		5.5	V
I <sub>SD</sub>	Shutdown current				1	μΑ

#### **DETAIL OPERATING DESCRIPTION**

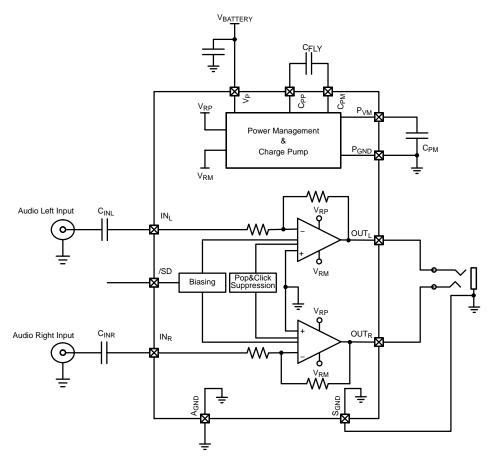

Figure 12. Typical Application Circuit

### **Detailed Descriptions**

The NCP2817 stereo headphone amplifier features the ON Semiconductor NOCAP architecture that eliminates the large output DC-blocking capacitors required by conventional headphone amplifier.

An integrated power supply block generates low noise positive  $(V_{RP})$  and negative  $(V_{RM})$  voltages from the positive supply voltage  $(V_P)$ . The stereo headphone amplifiers operate from these symmetrical supplies. Amplifiers output are referenced to ground (GND), instead of DC voltage (typically  $V_P/2$ ) for conventional headphone amplifiers.

The NCP2817 integrates two true ground amplifiers, an Under Voltage Lock Out (UVLO), a short circuit protection and a thermal shutdown circuitry. In addition, a special circuit is embedded to eliminate pop and click noise that occurs during turn on and turn off time.

NCP2817 has an embedded gain setting network set to 1.5 V/V.

#### **NOCAP<sup>TM</sup>**

NOCAP is a patented architecture which requires only two small ceramic capacitors. From single positive only rail, it generates the symmetrical positive and negative rails that supplies amplifiers output stage. This feature allows the output of the amplifiers to be biased around the ground level and eliminates need of huge DC voltage blocking capacitors.

#### LongPlay Architecture

The "LongPlay" feature, based on unique ultra low current consumption architecture saves more battery life by reducing the quiescent current depending on the load.

#### **Current Limit Protection Circuit**

The NCP2817 output power stage features a protection circuitry against short to ground. The current is limited to 300 mA typical when an output is shorted to GND and a signal is applied to the input.

#### **Thermal Overload Protection**

Internal amplifiers are switched off when the temperature exceed 160°C, and will be switched back on when the temperature decreases below 140°C.

#### **Under Voltage Lockout**

When the battery voltage decreases below 1.4 V, the amplifiers are turned off. The hysteresis to turn back on the device is 100 mV.

### **Pop and Click Suppression Circuitry**

The NCP2817 includes a special circuitry to eliminate any pop and click noise during turn on and turn off time.

During uncontrolled turn on and turn off sequences, normal amplifiers would create an output offset. This offset drives the loudspeaker and generates a parasitic noise called "pop and click noise".

The NCP2817 carefully controls the amplifier output stages during turn on and off sequences to eliminate this problem.

Input capacitor selection

The input coupling capacitor blocks the DC voltage at the amplifier input terminal. This capacitor creates a high–pass filter with the  $R_{\rm IN}$  input resistor (10 k $\Omega$  for NCP2817).

The size of the capacitor must be large enough to cut off low frequencies without severe attenuation in the audio bandwidth (20 Hz - 20 kHz).

The cut off frequency for the input high-pass filter is:

$$F_c = \frac{1}{2\pi R_{in} C_{in}}$$

With  $R_{IN} = 10 \text{ k}\Omega$ A  $F_c < 20 \text{ Hz}$  is recommended.

#### **Charge Pump Capacitor Selection**

Use ceramic capacitor with low ESR for better performances. X5R / X7R capacitor is recommended.

The  $C_{FLY}$  flying capacitor serves to transfer charge during the generation of the negative voltage and directly affects load regulation and charge pump output impedance. A too low value results in poor current performance while higher value increases charge pump regulation and lowers output impedance (until internal switches  $R_{DS(on)}$  becomes predominant). We recommend 1  $\mu F$ , but lower values can be uses in systems with lower audio power requirements.

The  $C_{PVM}$  capacitor must be equal at least to the  $C_{FLY}$  capacitor to allow maximum transfer charge. In addition, the ESR of  $C_{PVM}$  capacitor directly affects ripple on  $P_{VM}$  as well as charge pump output impedance. We recommend 1  $\mu F$ , but lower values can be uses in systems with lower audio power requirements.

Table 1. SUGGEST TYPICAL VALUE AND MANUFACTURER

Value	Reference	Package	Manufac- turer
1 μF	C1005X5R0J105K	0402	TDK
1 μF	GRM155R60J105K19	0402	Murata

#### **Power Supply Decoupling Capacitor (C1)**

The NCP2817 is a NOCAP amplifier and proper power supply bypassing is critical to reduce noise, high THD+N and PSRR performances. It is recommended to use a 1uF X5R / X7R ceramic capacitor and place it as close as possible to the  $V_P$  pin.

#### **Shutdown Function**

The device enters in shutdown mode when shutdown signal is low. During the shutdown mode, the DC quiescent current of the circuit does not exceed 1  $\mu A$ . In this configuration, the output impedance is 20  $k\Omega$  on each output.

#### **Layout Recommendation**

Minimize trace impedance of the power, the ground and all output traces. The voltage drop between NCP2817 and the headset load results in decrease of output power and efficiency. We strongly recommend using wide traces for power supply inputs to optimize the power supplies efficiency and regulation performances. Good ground connection improves the amplifier immunity to external switching noise, improves crosstalk between channels as well as general audio performances. We also recommend wide PCB traces for the power outputs routing. If possible, we recommend to use local Ground and power planes.

The power supply decoupling capacitor  $C_{BYP}$  will help to minimize the input voltage ripple during fast load transients. It is important to minimize traces impedances from  $C_{BYP}$  to GND plane and from  $C_{BYP}$  to  $V_P$  pin as close as possible of the  $V_P$  pin.  $C_{BYP}$  should be placed as close as possible to the  $V_P$  pin.

The charge pump creates the VPM negative voltage that supplies the amplifiers. C<sub>FLY</sub> and C<sub>PVM</sub> capacitors location and access impedances are also critical. Connect C<sub>FLY</sub> and C<sub>PVM</sub> as close as possible of the NCP2817 and route their terminal to the associated pin with wide traces to minimize impedance and optimize the charge pump ripple and efficiency performances. In addition, the C<sub>FLY</sub> and C<sub>PVM</sub> capacitors as well as the traces connecting capacitors to the device should be kept away from the audio input and output traces to avoid any switching noise coupling with the audio signal.

 $A_{GND}$  is the ground reference for all internal analog features so, particular attention should govern the  $A_{GND}$  pin connection to the Ground reference plane.  $A_{GND}$  pin should be directly connected to the board Ground reference plane and keep it separated from other ground connections. The  $A_{GND}$  to GND ground reference plane trace should not be shared with the trace between  $S_{GND}$  or  $P_{GND}$  and the Ground plane.
