

PI2EQXDP101-A

1 to 1 DisplayPortTM ReDriverTM

Features

- DisplayPort[™] 1.1a operation at reduced bit rate (1.62Gbps) and high bit rate (2.7Gbps)
- Jitter elimination circuits automatically adjust link via training path
 - Pre-Emphasis, and output swing
- Can support all 4 levels of output swing and 4 levels output pre-emphasis, as specified in the DisplayPort 1.1a spec.
- AUX interception circuit only listens to the link training, but does not affect link training
- Low insertion loss across the AUX signal path (0.35dB @1Mbps)
- Output can support dual mode DP by providing DDC signals across the AUX_sink pins
 - Using Cable Detect pin from DP connector (pin 13), the switch can toggle between DP and TMDS mode.
- · Automatic power down state when HPD signal is LOW
- Enters low power mode when no data signal is present
- Dual power supply (1.5V and 3.3V)
- 2KV HBM ESD protection
 - 50 ohm output termination can be turned off when port is off
- Port is turned off automatically when not needed
- Package (Pb-Free & Green available)
 - 36-pin TQFN (ZF)

Block Diagram

Description

The PI2EQXDP101-A is a one Input and one Output DisplayPort[™] ReDriver[™] that support a maximum data rate of 2.7 Gbps through each channel, which results in a total of 10.8Gbps through-put.

Output Level Swing and Output Pre-emphasis and number of active lanes are controlled by decoding the AUX command during link initialization. Also, utilizing the HPD signals from each DisplayPort port, the PI2EQXDP101-A can automatically enter power down state. Or, if the graphics driver is off and has no output signal, Pericom's PI2EQXDP101-A can automatically enter low power mode, even if an active monitor is attached.

36	VDD33	Power	Power Supply, $3.3V \pm 5\%$

AUX listener Register Assignment

AUX command are stored interpreted and stored in the registers, ReDriver will then be re-configured by default. Registers do not have a power-on default state.

Address	Name	Description	Access
00100h	Link initialization field AUX	LINK_BW_SET: Main Link Bandwidth Setting = Value x 0.27 Gbps per lane Bits 7:0 = LINK_BW_SET For DisplayPort version 1, revision 1a, only two values are supported. All other values are reserved. 06h = 1.62 Gbps per lane 0Ah = 2.7 Gbps per lane Source may choose either of the two link bandwidth as long as it does not ex- ceed the capability of DisplayPort receiver as indicated in the receiver capabil- ity field.	R/W
00101h	Link initialization field	LANE_COUNT_SET Bits3:0 = LANE_COUNT_SET 1h = One lane 2h = Two lanes 4h = Four lanes For one-lane configuration, Lane0 is used. For 2-lane configuration, Lane0 and Lane1 are used. Bits7:4 = RESERVED. Read all 0's.	R/W
00103h	DPCD Lane 0 status	TRAINING_LANE0_SET Link Training Control_Lane0 Bits1:0 = DRIVE_CURRENT_SET 00 - Training Pattern 1 w/ level 0 01 - Training Pattern 1 w/ level 1 10 - Training Pattern 1 w/ level 2 11 - Training Pattern 1 w/ level 3 Bit2 = MAX_CURRENT_REACHED Set to 1 when the maximum driven current setting is reached. Note: Support of programmable drive current is optional. For example if there is only 1 level, then program Bits2:0 to 100 to indicate to the receiver that Level 1 is the maximum drive current. Support of independent drive current controlfor each lane is also optional. Bit4:3 = PRE-EMPHASIS_SET 00 = Training Pattern 2 w/o pre-emphasis 01 = Training Pattern 2 w/ pre-emphasis level 1 10 = Training Pattern 2 w/ pre-emphasis level 2 11 = Training Pattern 2 w/ pre-emphasis level 3 Bit5 = MAX_PRE-EMPHASIS_REACHED	R/W
00104h	DPCD Lane 1 status	Lane setting for lane 1. The definition is the same as lane 0	R/W
00105h	DPCD Lane 2 status	Lane setting for lane 2. The definition is the same as lane 0	R/W
00106h	DPCD Lane 3 status	Lane setting for lane 3. The definition is the same as lane 0	R/W

AUX listener specification

DP AUX command interpreter will support Native AUX CH Syntax. Mapping of I²C onto AUX CH Syntax is not supported.

AUX command interpreter monitor AUX channel from requester and replier for transactions and stored AUX command from requester and reply command from replier that are related to the link settings.

The data from the following addresses will be extracted and stored into internal registers for controlling the ReDriver signal level, lane count and pre-emphasis setting.

00101h LANE_COUNT_SET 00103h TRAINING_LANE0_SET 00104h TRAINING_LANE1_SET 00105h TRAINING_LANE2_SET 00106h TRAINING_LANE3_SET

Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Storage Temperature	-65°C to +150°C
Supply Voltage to Ground Potential	-0.5V to +4.6V
DC SIG Voltage	0.5V to V_{DD} +0.5V
Current Output	-25mA to +25mA
Power Dissipation Continuous	
Operating Temperature	

Note:

Stresses greater than those listed under MAXIMUM RAT-INGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Notes:

1. Refer to Pre-emphasis waveform. For embedded connection, support of programmable voltage swing levels is optional.

2. Refer to Pre-emphasis waveform for definition of differential voltage. Support of no preemphasis, 3.5 dB and 6.0 dB pre-emphasis is required. Support of 9.5 dB level is optional. For embedded connection, support of programmable preemphasis levels is optional.
