

SLLIMM™ - 2nd series IPM, 3-phase inverter, 20 A, 600 V short-circuit rugged IGBT

Datasheet - production data

Applications

- 3-phase inverters for motor drives
- Home appliances such as washing machines, refrigerators, air conditioners and sewing machine

Description

This second series of SLLIMM (small low-loss intelligent molded module) provides a compact, high performance AC motor drive in a simple, rugged design. It combines new ST proprietary control ICs (one LS and one HS driver) with an improved short-circuit rugged trench gate field-stop (TFS) IGBT, making it ideal for 3-phase inverter systems such as home appliances and air conditioners. SLLIMM™ is a trademark of STMicroelectronics.

Features

- IPM 20 A, 600 V 3-phase IGBT inverter bridge including 2 control ICs for gate driving and freewheeling diodes
- 3.3 V, 5 V TTL/CMOS inputs with hysteresis
- Internal bootstrap diode
- Undervoltage lockout of gate drivers
- Smart shutdown function
- Short-circuit protection
- Shutdown input/fault output
- Separate open emitter outputs
- Built-in temperature sensor
- Comparator for fault protection
- Short-circuit rugged TFS IGBTs
- Very fast, soft recovery diodes
- 85 kΩ NTC UL 1434 CA 4 recognized
- Fully isolated package
- Isolation rating of 1500 Vrms/min

Symbol	Parameter	Value	Unit
$R_{th(j-c)}$	Thermal resistance junction-case single IGBT	1.85	$^{\circ}\text{C/W}$
	Thermal resistance junction-case single diode	2.8	

3 Electrical characteristics

$T_J = 25\text{ °C}$ unless otherwise noted.

3.1 Inverter part

Table 7: Static

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I_{CES}	Collector-cut off current	$V_{CE} = 600\text{ V}$, $V_{CC} = V_{boot} = 15\text{ V}$	-		100	μA
$V_{CE(sat)}$	Collector-emitter saturation voltage	$V_{CC} = V_{boot} = 15\text{ V}$, $V_{IN}^{(1)} = 0\text{ to }5\text{ V}$, $I_C = 15\text{ A}$	-	1.55	2.1	V
		$V_{CC} = V_{boot} = 15\text{ V}$, $V_{IN} = 0\text{ to }5\text{ V}$, $I_C = 20\text{ A}$	-	1.65		
V_F	Diode forward voltage	$V_{IN} = 0$, $I_C = 15\text{ A}$	-	1.54	2.15	V
		$V_{IN} = 0$, $I_C = 20\text{ A}$	-	1.65		V

Notes:

⁽¹⁾Applied between HINx, LINx and GND for x = U, V, W.

Table 8: Inductive load switching time and energy

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit	
$t_{on}^{(1)}$	Turn-on time	$V_{DD} = 300\text{ V}$, $V_{CC} = V_{boot} = 15\text{ V}$, $V_{IN}^{(2)} = 0\text{ to }5\text{ V}$, $I_C = 15\text{ A}$	-	320	-	ns	
$t_{c(on)}^{(1)}$	Cross-over time on		-	160	-		
$t_{off}^{(1)}$	Turn-off time		-	510	-		
$t_{c(off)}^{(1)}$	Cross-over time off		-	102	-		
t_{rr}	Reverse recovery time		-	290	-		
E_{on}	Turn-on switching energy		-	440	-		μJ
E_{off}	Turn-off switching energy		-	213	-		
E_{rr}	Reverse recovery energy	-	59	-			
$t_{on}^{(1)}$	Turn-on time	$V_{DD} = 300\text{ V}$, $V_{CC} = V_{boot} = 15\text{ V}$, $V_{IN}^{(2)} = 0\text{ to }5\text{ V}$, $I_C = 20\text{ A}$	-	338	-	ns	
$t_{c(on)}^{(1)}$	Cross-over time on		-	178	-		
$t_{off}^{(1)}$	Turn-off time		-	500	-		
$t_{c(off)}^{(1)}$	Cross-over time off		-	92	-		
t_{rr}	Reverse recovery time		-	300	-		
E_{on}	Turn-on switching energy		-	624	-		μJ
E_{off}	Turn-off switching energy		-	296	-		
E_{rr}	Reverse recovery energy	-	80	-			

Notes:

⁽¹⁾ t_{on} and t_{off} include the propagation delay time of the internal drive. $t_{c(on)}$ and $t_{c(off)}$ are the switching time of the IGBT itself under the internally given gate driving condition.

⁽²⁾Applied between HINx, LINx and GND for x = U, V, W.

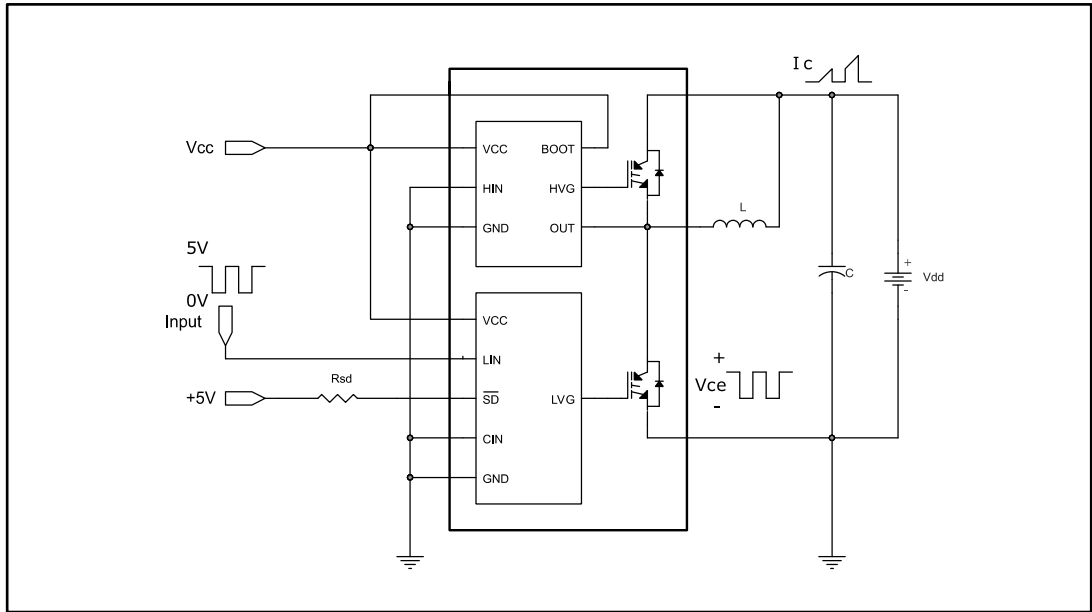

Figure 3: Switching time definition

3.2 Control / protection part

Table 9: High and low side drivers

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{il}	Low logic level voltage				0.8	V
V_{ih}	High logic level voltage		2			V
I_{INh}	IN logic "1" input bias current	$IN_x=15\text{ V}$	80	150	200	μA
I_{INl}	IN logic "0" input bias current	$IN_x=0\text{ V}$			1	μA
High side						
V_{CC_hys}	V_{CC} UV hysteresis		1.2	1.4	1.7	V
$V_{CC_th(on)}$	V_{CCH} UV turn-on threshold		11	11.5	12	V
$V_{CC_th(off)}$	V_{CC} UV turn-off threshold		9.6	10.1	10.6	V
V_{BS_hys}	V_{BS} UV hysteresis		0.5	1	1.6	V
$V_{BS_th(on)}$	V_{BS} UV turn-on threshold		10.1	11	11.9	V
$V_{BS_th(off)}$	V_{BS} UV turn-off threshold		9.1	10	10.9	V
I_{QBSU}	Undervoltage V_{BS} quiescent current	$V_{BS} = 9\text{ V}$, $HIN_x^{(1)} = 5\text{ V}$;		55	75	μA
I_{QBS}	V_{BS} quiescent current	$V_{CC} = 15\text{ V}$, $HIN_x^{(1)} = 5\text{ V}$		125	170	μA
I_{qccu}	Undervoltage quiescent supply current	$V_{CC} = 9\text{ V}$, $HIN_x^{(1)} = 0\text{ V}$		190	250	μA
I_{qcc}	Quiescent current	$V_{CC} = 15\text{ V}$, $HIN_x^{(1)} = 0\text{ V}$		560	730	μA
$R_{DS(on)}$	BS driver ON resistance			150		Ω
Low side						
V_{CC_hys}	V_{CC} UV hysteresis		1.1	1.4	1.6	V
$V_{CCL_th(on)}$	$VCCL$ UV turn-on threshold		10.4	11.6	12.4	V
$V_{CCL_th(off)}$	$VCCL$ UV turn-off threshold		9.0	10.3	11	V
I_{qccu}	Undervoltage quiescent supply current	$V_{CC} = 10\text{ V}$, \overline{SD} pulled to 5 V through $R_{SD} = 10\text{ k}\Omega$, $CIN = LIN_x^{(1)} = 0$		600	800	μA
I_{qcc}	Quiescent current	$V_{CC} = 15\text{ V}$, $\overline{SD} = 5\text{ V}$, $CIN = LIN_x^{(1)} = 0$;		700	900	μA
V_{SSD}	Smart \overline{SD} unlatch threshold		0.5	0.6	0.75	V
I_{SDh}	\overline{SD} logic "1" input bias current	$\overline{SD} = 5\text{ V}$	25	50	70	μA
I_{SDl}	\overline{SD} logic "0" input bias current	$\overline{SD} = 0\text{ V}$			1	μA

Notes:

(1) Applied between HIN_x , LIN_x and GND for $x = U, V, W$

Table 10: Temperature sensor output

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V _{T_{SO}}	Temperature sensor output voltage	T _j = 25 °C	0.974	1.16	1.345	V
I _{T_{SO}_SNK}	Temperature sensor sink current capability			0.1		mA
I _{T_{SO}_SRC}	Temperature sensor source current capability		4			mA

Table 11: Sense comparator (V_{CC} = 15 V, unless otherwise is specified)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I _{CIN}	CIN input bias current	V _{CIN} = 1 V	-0.2		0.2	μA
V _{ref}	Internal reference voltage		460	510	560	mV
V _{OD}	Open drain low level output voltage	I _{od} = 5 mA			500	mV
t _{CIN_SD}	C _{IN} comparator delay to \overline{SD}	\overline{SD} pulled to 5 V through R _{SD} =10 kΩ; measured applying a voltage step 0-1 V to pin CIN 50% CIN to 90% \overline{SD}	240	320	410	ns
SR _{SD}	\overline{SD} fall slew rate	\overline{SD} pulled to 5 V through R _{SD} =10 kΩ; C _L =1 nF through \overline{SD} and ground; 90% \overline{SD} to 10% \overline{SD}		25		V/μs

Comparator stay enabled even if V_{CC} is in UVLO condition but higher than 4 V.

4 Fault management

The device integrates an open-drain output connected to \overline{SD} pin. As soon as a fault occurs the open-drain is activated and LVGx outputs are forced low. Two types of fault can be pointed out:

- Overcurrent (OC) sensed by the internal comparator (see more detail in [Section 4.2: "Smart shutdown function"](#))
- Undervoltage on supply voltage (V_{CC})

Each fault enables the \overline{SD} open drain for a different time; refer to the following [Table 12: "Fault timing"](#)

Table 12: Fault timing

Symbol	Parameter	Event time	SD open-drain enable time result
OC	Overcurrent event	$\leq 20 \mu s$	20 μs
		$\geq 20 \mu s$	OC time
UVLO	Undervoltage lock out event	$\leq 50 \mu s$	50 μs
		$\geq 50 \mu s$ until the V_{CC_LS} exceed the V_{CC_LS} UV turn ON threshold	UVLO time

Actually the device remains in a fault condition (\overline{SD} at low logic level and LVGx outputs disabled) for a time also depending on RC network connected to \overline{SD} pin. The network generates a time contribute, which is added to the internal value.

Figure 4: Overcurrent timing (without contribution of RC network on \overline{SD})

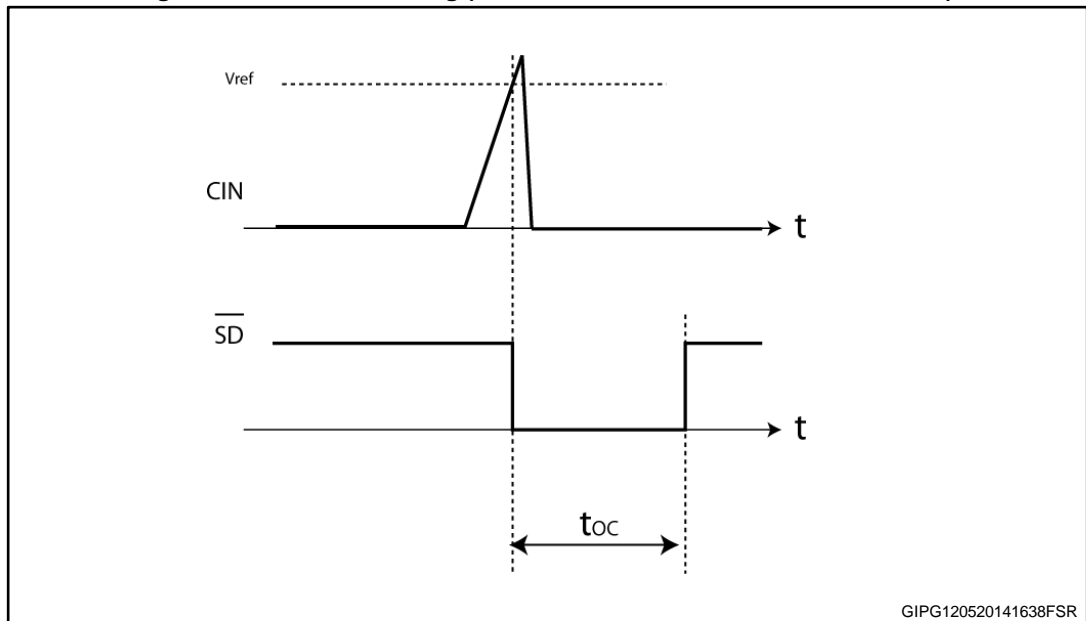

Figure 5: UVLO timing (without contribution of RC network on \overline{SD})

4.1 TSO output

The device integrates temperature sensor. A voltage proportional to die temperature is available on TSO pin. When this function is not used the Pin can be left floating.

4.2 Smart shutdown function

The device integrates a comparator committed to the fault sensing function. The comparator input can be connected to an external shunt resistor in order to implement a simple overcurrent detection function.

The output signal of the comparator is fed to an integrated MOSFET with the open drain output available on \overline{SD} input. When the comparator triggers, the device is set in shutdown state and its outputs are all set to low level.

Figure 6: Smart shutdown timing waveforms in case of overcurrent event

$R_{ON_OD} = V_{OD} / 5 \text{ mA}$ see [Table 11: "Sense comparator \(VCC = 15 V, unless otherwise is specified\)"](#); $R_{PD_SD} \text{ (typ)} = 5 \text{ V} / I_{SDH}$

In common overcurrent protection architectures, the comparator output is usually connected to the \overline{SD} input and an RC network is connected to this \overline{SD} input and an RC

network is connected to this \overline{SD} input and an RC network is connected to this \overline{SD} line in order to provide a mono-stable circuit, which implements a protection time that follows the fault condition.

Differently from the common fault detection systems, the device Smart shutdown architecture allows to immediately turn-off the outputs gate driver in case of fault, by minimizing the propagation delay between the fault detection event and the actual outputs switch-off. In fact the time delay between the fault and the outputs turn off is no more dependent on the RC value of the external network connected to the pin.

In the smart shutdown circuitry, the fault signal has a preferential path which directly switches off the outputs after the comparator triggering.

At the same time the internal logic turns on the open drain output and holds it on until the \overline{SD} input and an RC network is connected to this \overline{SD} voltage goes below the V_{SSD} threshold and t_{oc} time is elapsed.

The driver outputs restart following the input pins as soon as the voltage at the \overline{SD} input and an RC network is connected to this \overline{SD} pin reaches the higher threshold of the \overline{SD} input and an RC network is connected to this \overline{SD} logic input.

The Smart shutdown system provides the possibility to increase the time constant of the external RC network (that is the disable time after the fault event) up to very large values without increasing the delay time of the protection.

5 Application circuit example

Figure 7: Application circuit example

Application designers are free to use a different scheme according with the specifications of the device.

5.1 Guidelines

1. Input signals HIN, LIN are active-high logic. A 100 k Ω (typ.) pull-down resistor is built-in for each input pin. To prevent input signal oscillation, the wiring of each input should be as short as possible and the use of RC filters (R1, C1) on each input signal is suggested. The filters should be done with a time constant of about 100 ns and placed as close as possible to the IPM input pins.
2. The use of a bypass capacitor C_{VCC} (aluminum or tantalum) can help reduce the transient circuit demand on the power supply. Also, to reduce high frequency switching noise distributed on the power lines, placing a decoupling capacitor C₂ (100 to 220 nF, with low ESR and low ESL) as close as possible to each Vcc pin and in parallel with the bypass capacitor is suggested.
3. The use of RC filter (RSF, CSF) for preventing protection circuit malfunction is recommended. The time constant (RSF x CSF) should be set to 1us and the filter must be placed as close as possible to the CIN pin.
4. The \overline{SD} is an input/output pin (open drain type if used as output). It is recommended that it be pulled up to a power supply (i.e., MCU bias at 3.3/5 V) by a resistor value able to keep the I_{od} no higher than 5 mA (V_{OD} \leq 500 mV when open drain MOSFET is ON). The filter on \overline{SD} should be sized to get a desired re-starting time after a fault event and placed as close as possible to the \overline{SD} pin.
5. A decoupling capacitor C_{TSO} between 1 nF and 10 nF can be used to increase the noise immunity of the TSO thermal sensor; a similar decoupling capacitor C_{OT} (between 10 nF and 100 nF) can be implemented if the NTC thermistor is available and used. In both cases, their effectiveness is improved if the capacitors are placed close to the MCU.
6. The decoupling capacitor C₃ (100 to 220 nF with low ESR and low ESL) in parallel with each C_{boot} is useful to filter high frequency disturbances. Both C_{boot} and C₃ (if present) should be placed as close as possible to the U,V,W and V_{boot} pins. Bootstrap negative electrodes should be connected to U,V,W terminals directly and separated from the main output wires.
7. To prevent overvoltage on the V_{CC} pin, a Zener diode (Dz1) can be used. Similarly on the V_{boot} pin, a Zener diode(Dz2) can be placed in parallel with each C_{boot}.
8. The use of the decoupling capacitor C₄ (100 to 220 nF, with low ESR and low ESL) in parallel with the electrolytic capacitor C_{vdc} is useful to prevent surge destruction. Both capacitors C₄ and C_{vdc} should be placed as close as possible to the IPM (C₄ has priority over C_{vdc}).
9. By integrating an application-specific type HVIC inside the module, direct coupling to the MCU terminals without an opto-coupler is possible.
10. Low inductance shunt resistors should be used for phase leg current sensing
11. In order to avoid malfunctions, the wiring between N pins, the shunt resistor and PWR_GND should be as short as possible.
12. The connection of SGN_GND to PWR_GND at only one point (close to the shunt resistor terminal) can help to reduce the impact of power ground fluctuation.

These guidelines are useful for application design to ensure the specifications of the device. For further details, please refer to the relevant Application note.

Table 13: Recommended operating conditions

Symbol	Parameter	Test condition	Min	Typ	Max	Unit
V_{PN}	Supply voltage	Applied between P-Nu, N _v , N _w		300	400	V
