## Description

The 9DBU0241 is a member of IDT's 1.5 V Ultra-Low-Power (ULP) PCle family. It has integrated output terminations providing $\mathrm{Zo}=100 \mathrm{ohms}$ for direct connection to 100 ohm transmission lines. The device has 2 output enables for clock management.

## Recommended Application

1.5V PCle Gen1-2-3 Zero-Delay/Fan-out Buffer (ZDB/FOB)

## Output Features

- 2 - 1-167MHz Low-Power (LP) HCSL DIF pairs $w / Z o=100 \Omega$

## Key Specifications

- DIF cycle-to-cycle jitter <50ps
- DIF output-to-output skew <50ps
- DIF phase jitter is PCle Gen1-2-3 compliant
- DIF bypass mode additive phase jitter is $<300 \mathrm{fs}$ rms for PCle Gen3
- DIF bypass mode additive phase jitter <350fs rms for 12k-20MHz

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9DBU0241. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

${ }^{1}$ Guaranteed by design and characterization, not $100 \%$ tested in production.
${ }^{2}$ Measured from differential waveform
${ }^{3}$ Slew rate is measured through the Vswing voltage range centered around differential $0 V$. This results in $a+/-150 \mathrm{mV}$ window around differential OV.
${ }^{4}$ Matching applies to rising edge rate for Clock and falling edge rate for Clock\#. It is measured using a $+/-75 \mathrm{mV}$ window centered on the average cross point where Clock rising meets Clock\# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.
${ }^{5}$ Vcross is defined as voltage where Clock = Clock\# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock\# falling).
${ }^{6}$ The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting $\Delta$-Vcross to be smaller than Vcross absolute.
${ }^{7}$ At default SMBus settings.

## Marking Diagrams

Notes:

1. "LOT" is the lot sequence number.
2. YYWW is the last two digits of the year and week that the part was assembled.
3. Line 2: truncated part number
4. "L" denotes RoHS compliant package.
5. "I" denotes industrial temperature range device.

"LF" suffix to the part number are the Pb-Free configuration and are RoHS compliant. " $A$ " is the device revision designator (will not correlate with the datasheet revision).

## Revision History

| Rev. | Initiator | Issue Date | Description | Page \# |
| :---: | :---: | :---: | :--- | :---: |
| A | RDW | $7 / 14 / 2014$ | 1. Updated electrical tables with char data. <br> 2. Added an additive phase jitter plot. <br> 3. Added 12kHz to 20MHz additive phase jitter spec. <br> 4. Updated Amplitude control bit descriptions in Byte 1. | Various |
| B | RDW | $9 / 19 / 2014$ | Updated SMBus Input High/Low parameters conditions, MAX values, <br> and footnotes. | 6 |
| C | RDW | $4 / 22 / 2015$ | 1. Updated pin out and pin descriptions to show ePad on package <br> connected to ground. <br> 2. Updated front page text to standard format for these devices. Added <br> explicit bullet indicated Spread Spectrum compatibility. <br> 3. Updated Clock Input Parameters table to be consistent with PCle <br> Vswing parameter. <br> 4. Minor updates to front page text for family consistency. <br> 5. Add note about epad to Power Connections table. | $1-5$ |
