STw5098

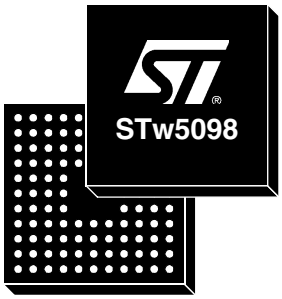
Dual low power asynchronous stereo audio Codec with integrated power amplifiers

Features

- Dual 20 bit audio resolution, 8kHz to 96kHz independent rate ADC and DAC
- Dual I^2S or PCM digital interfaces for dual master
- Sustain complex voice and audio flow with or without mixing
- I^2C/SPI compatible control I/F
- Asynchronous sampling ADC and DAC: they do not require oversampled clock and information on the audio data sampling frequency (fs). Jitter tolerant fs
- Wide master clock range: from 4MHz to 32MHz
- Stereo headphones drivers, handsfree loudspeaker driver, line out drivers
- Mixable analog line inputs
- Voice filters: 8/16kHz with voice channel filters
- Automatic gain control for microphone and line-in inputs
- Frequency programmable clock outputs
- Multibit ΣΔ modulators with data weighted averaging ADC and DAC
- DSP functions for bass-treble-volume control, mute, mono/stereo selection, voice channel filters, de-emphasis filter and dynamic compression
- 93 dB dynamic range ADC, 0.001% THD with full scale output @ 2.7V
- 95 dB dynamic range DAC, 0.02% THD performance @ 2.7V over 16Ω load

Applications

- Digital cellular telephones with application processor such as mp3 or gaming and Bluetooth concurrent application



LFBGA 6x6x1.4 (112 pins)
VFBGA 5x5x1 (112 pins)

Description

STw5098 is a dual low power asynchronous stereo audio CODEC device with headphones amplifiers for high quality audio listening and recording.

Two I2S/PCM digital interfaces are available, one per master for example Bluetooth and Application Processor, enabling concurrent audio and voice flow between Network and user.

The STw5098 control registers are accessible through a selectable I^2C-bus compatible or SPI compatible interface.

List of tables

List of figures

1 Overview

- Dual 20 bit audio resolution, 8kHz to 96kHz independent rate ADC and DAC
- Dual I^2S/PCM digital interfaces for dual master
- Sustain complex voice and audio flow with or without mixing
- Two I^2C/SPI compatible independent control interfaces
- Asynchronous sampling ADC and DAC that do not require oversampled clock and information on the audio data sampling frequency (fs). Jitter tolerant fs
- Wide master clock range from 4MHz to 32MHz
- Two stereo headphones drivers, hand free loudspeaker driver, line out drivers
- Mixable analog line inputs
- Voice filters: 8/16kHz with voice channel filters
- Automatic gain control for microphone and line-in inputs
- Four programmable master/slave serial audio data interfaces: I^2S, SPI, PCM compatible and other formats
- Frequency programmable clock outputs
- Multibit $\Sigma\Delta$ modulators with data weighted averaging ADC and DAC
- Four DSP functions for bass-treble-volume control, mute, mono/stereo selection, voice channel filters, de-emphasis filter and dynamic compression
- 93 dB dynamic range ADC, 0.001% THD with full scale with full scale output @ 2.7V
- 95 dB dynamic range DAC, 0.02% THD performance @ 2.7V over 16Ω load

Analog inputs

- Selectable stereo differential or single-ended microphone amplifier inputs with 51dB range programmable gain
- 2 microphone biasing output
- Microphone plug-in and push-button detection input
- Selectable stereo differential or single-ended line inputs with 38dB range programmable gain

Analog output drivers

- 2 Stereo headphones outputs. driving capability: 40mW (0.1% THD) over 16Ω with 40dB range programmable gain
- Common mode voltage headphones driver (phantom ground)
- 1 Balanced loudspeaker output with driving capability up to 500mW (V_{CCLS}>3.5V; 1% THD) over 8Ω with 30dB range programmable gain
- 1 Balanced earphone output with driving capability up to 125mW
- Transient suppression filter during power up and power down
- Balanced/unbalanced stereo line outputs with 1 kΩ driving capability

2 Pinout

Table 1. STw5098 pin description

Position	Type	Pin name	Description
A1	P	GND	Ground pin for the digital section
A2	DI	1SCLK	Control interface serial clock input
A3	DO	1AD_OCK	Oversampled clock out from AD clock generator
A4	DIOD	2SDA/SDIN	Control interface serial data input-output in I^2C mode (SDA), control interface serial data input in SPI mode (SDIN).
A5	DO	1DA_OCK	Oversampled clock out from DA clock generator
A6	DIO	1AD_CK	Serial data clock for stereo A/D converter
A7	DI	2AS/CSB	Control interface address select in I^2C mode (AS). Interface enable signal in SPI mode (CSB).
A8	DO	2AD_DATA	Serial data out for stereo A/D converter
A9	DIO	2AD_SYNC	Frame sync for stereo A/D converter
A10	DIO	1DA_SYNC	Frame sync for stereo D/A converter
A11	DI	1DA_DATA	Serial data In for stereo D/A converter
B1	AI	2HDET	Headset detection input (microphone plug-in and push-button detection)
B2	DI	2SCLK	Control interface serial clock input
B3	DO	2AD_OCK	Oversampled clock out from AD clock generator
B4	DI	1CMOD	Control interface type selector I^2C-bus mode or SPI mode
B5	DO	2DA_OCK	Oversampled clock out from DA clock generator
B6	DIO	2DA_CK	Serial data clock for stereo D/A converter
B7	DI AI	AMCK	Master clock input. Accepted range 4 MHz to 32 MHz. AMCK is a digital square wave AMCK is an analog sinewave (*Section 10.2 on page 62*)
B8	P	VCC	Power supply pin for the digital section. Operating range: from 1.71 V to 2.7 V
B9	DIO	2DA_SYNC	Frame sync for stereo D/A converter
B10	DI	2DA_DATA	Serial data in for stereo D/A converter
B11	P	GND	Ground pin for the digital section
C1	P	VCCA	Power supply pin for the analog section. Standard operating range: from 2.7V to 3.3V Low voltage (LV) range: from 2.4V to 2.7V
C2	AI	1HDET	Headset detection input (microphone plug-in and push-button detection)
C3	P	VCCA	Power supply pin for the analog section. Standard operating range: from 2.7V to 3.3V Low voltage (LV) range: from 2.4V to 2.7V
C4	DI	2CMOD	Control interface type selector I^2C-bus mode or SPI mode.

Table 1. STw5098 pin description

Position	Type	Pin name	Description
C5	DIOD	1SDA/SDIN	Control interface serial data input-output in I^2C mode (SDA). Control interface serial data input in SPI mode (SDIN).
C6	DIO	2AD_CK	Serial data clock for stereo A/D converter
C7	DO	1AD_DATA	Serial data out for stereo A/D converter
C8	DIO	1AD_SYNC	Frame sync for stereo A/D converter
C9	DO	2IRQ	Programmable interrupt output. Active low signal.
C10	AO	2MBIAS	Microphone biasing pin. Fixed voltage reference
C11	AO	1MBIAS	Microphone biasing pin. Fixed voltage reference
D1	AI	2AUX1L	Left and right channel single ended pins for microphone or line input
D2	AI	1AUX1L	Left and right channel single ended pins for microphone or line input
D3	AI	1MICLN	Left and right channel differential pins for microphone input
D4	P	VCC	Power supply pin for the digital section. Operating range: from 1.71V to 2.7V
D5	P	VCCIO	Power supply pin for the digital I／ O buffers. Operating ranges: from 1.2V to 1.8V and from 1.71V to V_{CC}
D6	DIO	1DA_CK	Serial data clock for stereo D/A converter
D7	DI	1AS/CSB	Control interface address select in I^2C mode (AS) Interface enable signal in SPI mode (CSB)
D8	DO	1IRQ	Programmable interrupt output. Active low signal.
D9	P	VCCA	Power supply pin for the analog section. Standard operating range: from 2.7V to 3.3V Low voltage (LV) range: from 2.4V to 2.7V
D10	AI	1AUX1R	Left and right channel single ended pins for microphone or line input
D11	AI	2AUX1R	Left and right channel single ended pins for microphone or line input
E1	AI	2AUX3L	Left and right channel single ended pins for microphone or line input
E2	AI	1AUX3L	Left and right channel single ended pins for microphone or line input
E3	AI	1MICLP	Left and right channel differential pins for microphone input
E4	AI	2MICLN	Left and right channel differential pins for microphone input
E8	AI	2CAPLINEIN	A capacitor must be connected between CAPLINEIN and ground
E9	AI	1MICRN	Left and right channel differential pins for microphone input
E10	AI	2AUX3R	Left and right channel single ended pins for microphone or line input
E11	AI	2MICRN	Left and right channel differential pins for microphone input
F1	AI	2CAPMIC	A capacitor must be connected between CAPMIC and ground.
F2	AI	1CAPMIC	A capacitor must be connected between CAPMIC and ground
F3	P	GNDA	Ground pin for the analog section
F4	AI	2MICLP	Left and right channel differential pins for microphone input

Table 1. STw5098 pin description

Position	Type	Pin name	Description
F8	AI	1CAPLINEIN	A capacitor must be connected between CAPLINEIN and ground
F9	AI	1MICRP	Left and right channel differential pins for microphone input
F10	AI	1AUX3R	Left and right channel single ended pins for microphone or line input
F11	AI	2MICRP	Left and right channel differential pins for microphone input
G1	AI	1AUX2LN	Left and right channel differential pins for microphone or line input
G2	AI	2AUX2LN	Left and right channel differential pins for microphone or line input
G3	AI	1LINEINL	Left and right channel single ended pins for line input
G4	AI	2LINEINL	Left and right channel single ended pins for line input
G8	P	GNDA	Ground pin for the analog section
G9	AI	1AUX2RP	Left and right channel differential pins for microphone or line input.
G10	AI	1AUX2RN	Left and right channel differential pins for microphone or line input
G11	AI	2AUX2RN	Left and right channel differential pins for microphone or line input
H1	AI	1AUX2LP	Left and right channel differential pins for microphone or line input
H2	AI	2AUX2LP	Left and right channel differential pins for microphone or line input
H3	AO	2OLN	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
H4	P	GNDCM	Ground pin for analog reference. GNDCM can be connected to GNDA
H5	AO	1EARPS	EARPS, EARNS (sense) pins must be connected on the application board to EARP, EARN pins respectively. The connection must be as close as possible to the pins.
H6	AO	1EARP	Analog differential loudspeaker amplifier output for left channel or right channel or the sum of both. This output can drive 50nF (with series resistor) or directly an earpiece transductor from 8Ω to 32Ω Can deliver from 500mW to 125mW.
H7	P	VCCP	Power supply pin for the left and right output drivers (headphones and line-out). Operating range: from V_{CCA} to 3.3V
H8	AO	1HPR	Audio single ended headphones amplifier outputs for left and right channels. The outputs can drive 50nF (with series resistor) or directly an earpiece transductor of 16Ω
H9	AO	2ORN	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
H10	AI	2LINEINR	Left and right channel single ended pins for line input
H11	AI	2AUX2RP	Left and right channel differential pins for microphone or line input
J1	AO	1OLN	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.

Table 1. STw5098 pin description

Position	Type	Pin name	Description
J2	AO	1OLP	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
J3	AO	2OLP	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
J4	AO	2HPL	Audio single ended headphones amplifier outputs for left and right channels. The outputs can drive 50nF (with series resistor) or directly an earpiece transductor of 16Ω
J5	AO	1VCMHP	Common mode voltage headphones output. The negative pins of headphones left and right speakers can be connected to this pin to avoid decoupling capacitors.
J6	AI	1CAPEAR	A capacitor can be connected between this node and ground
J7	AO	1EARN	Analog differential loudspeaker amplifier output for Left channel or Right channel or the sum of both. This output can drive 50nF (with series resistor) or directly an earpiece transductor from 8Ω to 32Ω; It can deliver from 500mW to 125mW.
J8	P	VCCLS	Power supply pin for the mono differential output driver. Operating range: from V_{CCA} to 5.5V
J9	AO	2ORP	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
J10	AO	1ORN	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
J11	AI	1LINEINR	Left and right channel single ended pins for line input
K1	P	GNDCM	Ground pin for analog reference. GNDCM can be connected to GNDA
K2	P	VCCP	Power supply pins for the left and right output drivers (headphones and line-out). Operating range: from V_{CCA} to 3.3V
K3	AO	1HPL	Audio single ended headphones amplifier outputs for left and right channels. The outputs can drive 50nF (with series resistor) or directly an earpiece transductor of 16Ω
K4	AO	2VCMHPS	VCMHPS (sense) pin must be connected on the application board to VCMHP pin. The connection must be as close as possible to the pins.
K5	P	VCCLS	Power supply pin for the mono differential output driver. Operating range: from V_{CCA} to 5.5V
K6	P	GNDP	Ground pin for the left, right and mono-differential output drivers. GNDP and GNDA must be connected together.
K7	P	GNDP	Ground pin for the left, right and mono-differential output drivers. GNDP and GNDA must be connected together.

Table 1. STw5098 pin description

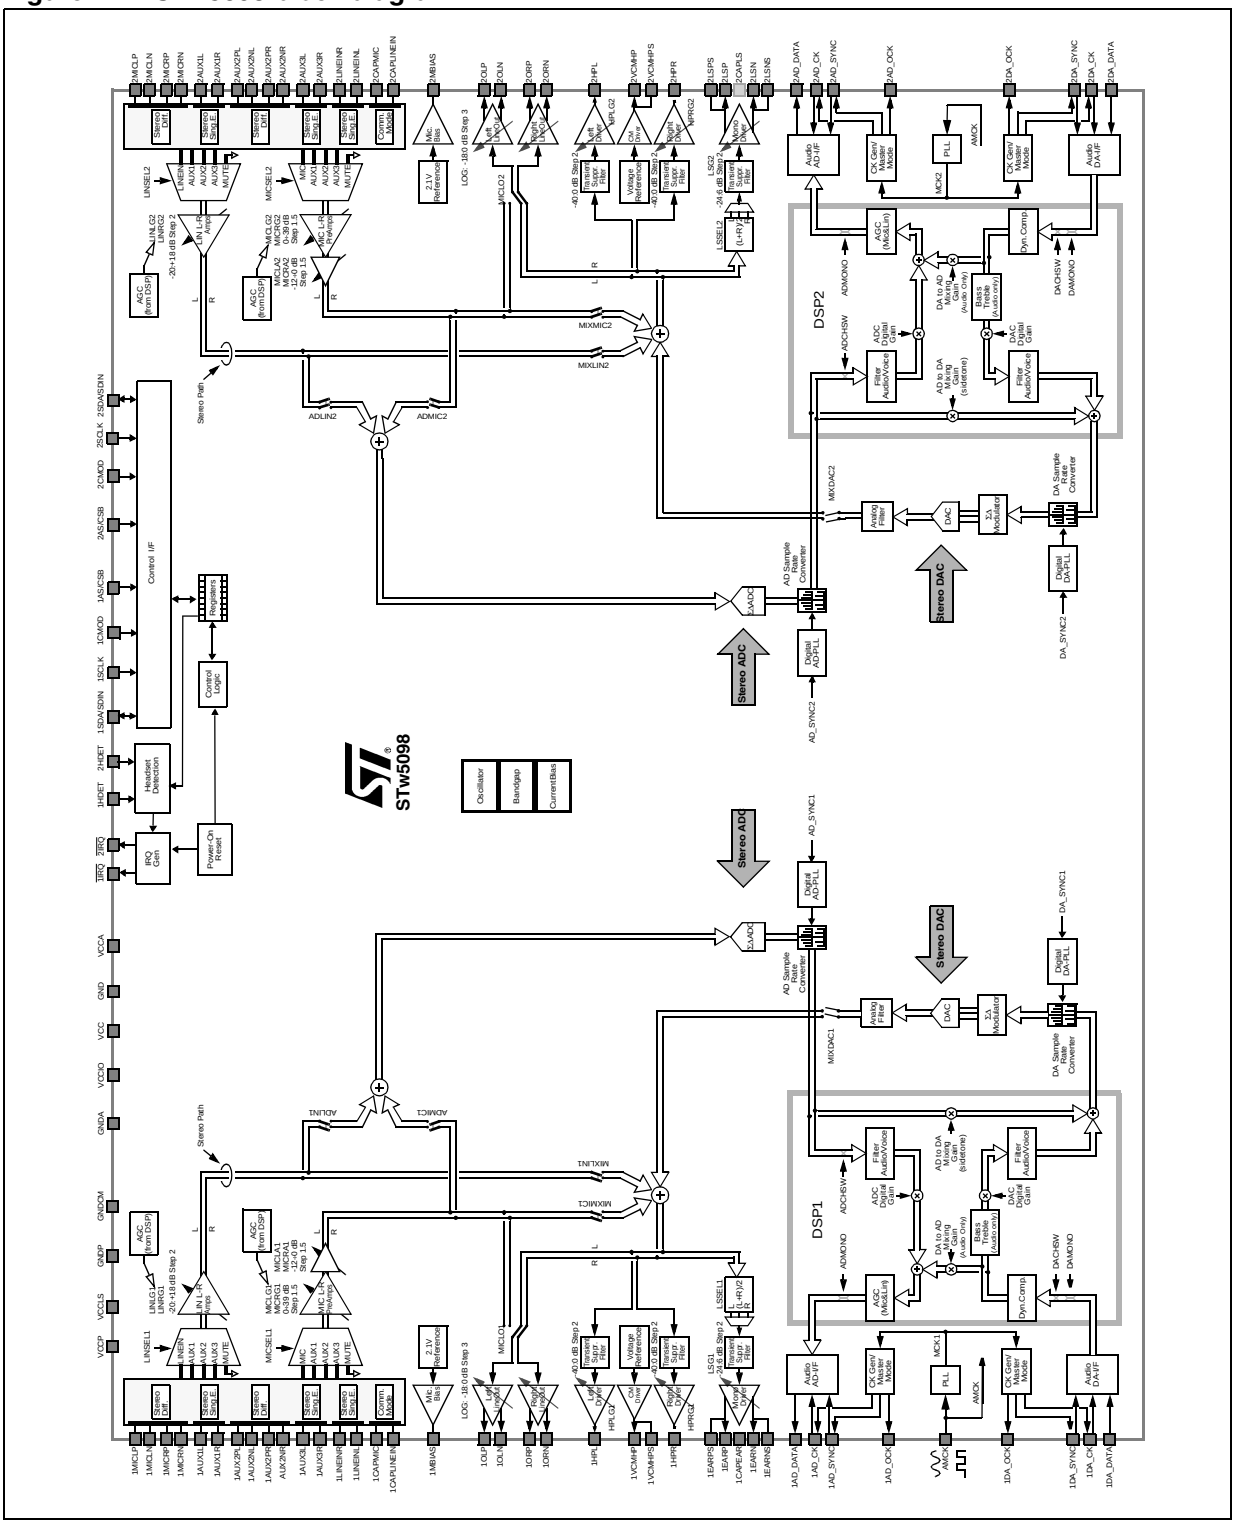
Position	Type	Pin name	Description
K8	AO	1EARNS	EARPS, EARNS (sense) pins must be connected on the application board to EARP, EARN pins respectively. The connection must be as close as possible to the pins.
K9	P	VCCLS	Power supply pins for the mono differential output driver. Operating range: from V_{CCA} to 5.5V
K10	AO	1ORP	Audio differential line out amplifier for left and right channels. This outputs can drive up to 1kΩ resistive load. Can be used as single ended output.
K11	P	GNDP	Ground pin for the left, right and mono-differential output drivers. GNDP and GNDA must be connected together.
L1	P	VCCP	Power supply pin for the left and right output drivers (headphones and line-out). Operating range: from V_{CCA} to 3.3V
L2	P	GNDP	Ground pin for the left, right and mono-differential output drivers. GNDP and GNDA must be connected together.
L3	AO	1VCMHPS	VCMHPS (sense) pin must be connected on the application board to VCMHP pin. The connection must be as close as possible to the pins.
L4	AO	2VCMHP	Common mode voltage headphones output. The negative pins of headphones left and right speakers can be connected to this pin to avoid decoupling capacitors.
L5	AO	2LSPS	LSPS, LSNS (sense) pins must be connected on the application board to LSP, LSN pins respectively. The connection must be as close as possible to the pins.
L6	AO	2LSP	Analog differential loudspeaker amplifier output for Left channel or Right channel or the sum of both. This output can drive 50nF (with series resistor) or directly an earpiece transductor of 8Ω; It can deliver up to 500mW.
L7	AI	2CAPLS	A capacitor can be connected between this node and ground
L8	AO	2LSN	Analog differential loudspeaker amplifier output for Left channel or Right channel or the sum of both. This output can drive 50nF (with series resistor) or directly an earpiece transductor of 8Ω Can deliver up to 500mW.
L9	AO	2LSNS	LSPS, LSNS (sense) pins must be connected on the application board to LSP, LSN pins respectively. The connection must be as close as possible to the pins.
L10	P	VCCP	Power supply pin for the left and right output drivers (headphones and line-out). Operating range: from V_{CCA} to 3.3V
L11	AO	2HPR	Audio single ended headphones amplifier outputs for left and right channels. The outputs can drive 50nF (with series resistor) or directly an earpiece transductor of 16Ω

Type definitions

AI	-	Analog input
AO	-	Analog output
AIO	-	Analog input output
DI	-	Digital input
DO	-	Digital output
DIO	-	Digital input output
DIOD	-	Digital input output open drain
P	-	Power supply or ground

3 Block diagram

Figure 2. STw5098 block diagram



4 Functional description

4.1 Naming convention

The STw5098 is composed of two identical entities, with their respective set of control registers.

Regarding the pin labelling, a pin name preceded by 1 refers to entity 1 and a pin name preceded by 2 refers to entity 2 (ie.g. 1SCLK, 2SCLK). In the following sections, no distinction is made between the two entities when it is not relevant. Consequently, the 1 and 2 prefixes for entities 1 and 2 respectively are omitted. The same naming convention applies to the control registers (CRxxx).

4.2 Power supply

STw5098 can have different supply voltages for different blocks, to optimize performance, power consumption and connectivity. See *Section 9.2 on page 59* for voltage definition.

The correct sequence to apply supply voltage is to set first (and unset last) the digital I/O supply (V_{CCIO}). The other supply voltages can be set in any order and can be disconnected individually, if needed. Disconnection does not cause any harm to the device and no extra current is pulled from any supply during this operation. Moreover if a voltage conflict is detected, like $V_{CCA} < V_{CC}$ (not allowed), simply all blocks connected to V_{CCA} are set to power down and no extra current is pulled from supply.

When V_{CCIO} is set and V_{CC} (digital supply) is not set, all the digital output pins are in high impedance state, while the digital inputs are disconnected to avoid power consumption for any input voltage value between GND and V_{CCIO}. Before V_{CC} is disconnected the device has to be reset (SWRES bit in CR30).

When the analog supply (V_{CCA}) is set and V_{CC} is not set, all the analog inputs are in high impedance state.

The two sets of control registers are powered by VCC pins (digital supply) so if these pins are disconnected all the information stored in control registers is lost. When the digital supply voltage is set, a power-on-reset (POR) circuit sets all the registers content to the default value and then generates IRQ signals writing 1 in bits PORMSK end POREV in CR31 and CR32 respectively for both entities.

All supplies must be on during operation.

4.3 Device programming

STw5098 can be programmed by writing Control Registers with SPI or I^2C compatible control interface (both slave). The interface is always active, there is no need to have the master clock running to program the device registers. The control interfaces of each entity can be operated independently either in SPI or I2C modes.

The choice between the two interfaces for each entity is done via their input pins 1CMOD and 2CMOD (CMOD):

1. CMOD connected to GND: I^2C compatible mode selected
   The device address is selected with AS pin:

AS/CSB connected to GND: chip address 0011010**0**1(35hex) for reading, 0011010**0**0 (34hex) for writing

AS/CSB connected to V_{CCIO}: chip address 0011010**1**1(37hex) for reading, 0011010**1**0 (36hex) for writing

   When this mode is selected control registers are accessed through pins:
   SCLK (clock)
   SDA (serial data out/in, open drain)

2. CMOD connected to V_{CCIO}: SPI compatible mode selected
   When this mode is selected control registers are accessed through:
   AS/CSB (chip select, active low)
   SCLK (clock)
   SDIN (serial data in)
   AD_OCK or DA_OCK or IRQ (serial data out, if selected)

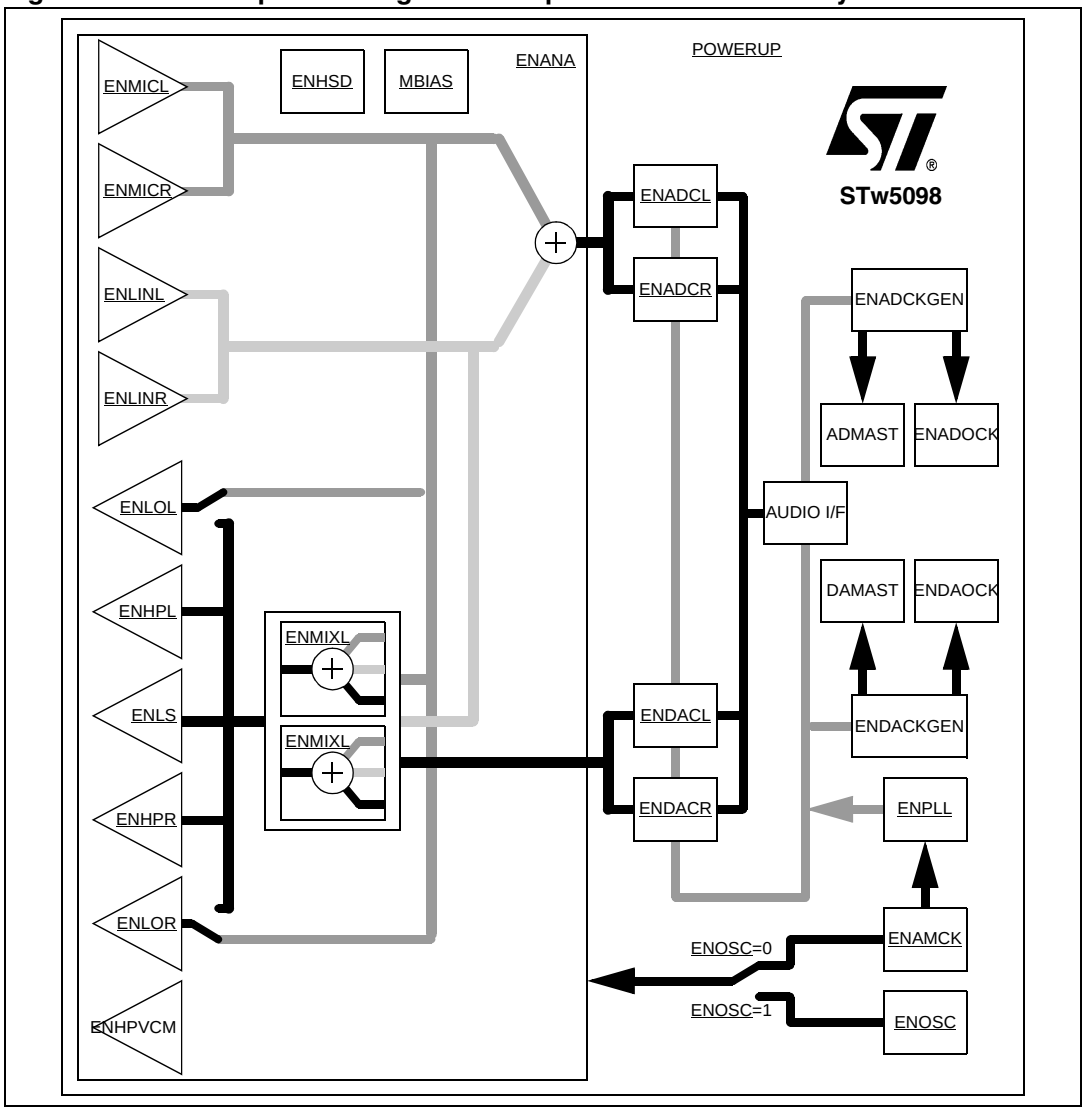
Device Programming: I^2C. The I^2C Control Interface timing is shown in *Section 6.1 on page 50*. The interface has an internal counter that keeps the current address of the control register to be read or written. At each write access of the interface the address counter is loaded with the data of the *register address* field. The value in the address counter is increased after each data byte read or write. It is possible to access the interface in 2 modes: single-byte mode in which the address and data of a single register are specified, and multi-byte mode in which the address of the first register to be written or read is specified and all the following bytes exchanged are the data of successive registers starting from the one specified (in multi-byte mode the internal address counter restart from register 0 after the last register 36). Using the multi-byte mode it is possible to write or read all the registers with a single access to the device on the I^2C bus. This applies to both entities of the device.

Device Programming: SPI. The SPI Control Interface timing is shown in section *Section 6.2 on page 51*. Bits SPIOSEL (SPI Output Select) in CR33 control the out pin selection for serial data out (none, AD_OCK, DA_OCK or IRQ), while bit SPIOHIZ=1 in CR33 selects the high impedance state of serial data out pin when idle. The first bit sent on SDIN, after AS/CSB falling edge, sets the interface for writing (SDIN=1) or reading (SDIN=0), then a 7-bit Control Register address follows.
If the interface is set for writing then the last 8 bits on SDIN are written in the control register.
If the interface is set for reading then after the 7 bit address STw5098 sends out 8 bits data on the pin selected with bits SPIOSEL in CR33, while bits present at SDIN pin are ignored.
If SPIOSEL=00 (no out pin selected) the reading access on SPI interface can still be useful to clear the IRQ event bits in CR32.

4.4 Power up

STw5098 internal blocks can individually be switched on and off according to the user needs. A general power-up bit is present at bit 7 of CR0. The output drivers should always be powered up after the general power up. See the following drawing to select the needed block for the desired function. A fast-settling function is activated to quickly charge external capacitors when the device is switched on (CAPLS, CAPLINEIN and CAPMIC).

Figure 3. Power up block diagram: example shown for one entity



4.5 Master clock

Master clock is applied to both entities. The master clock pin (AMCK) accepts any frequency from 4 MHz to 32 MHz. The 4-32 MHz range is divided in sub-ranges that have to be programmed in bits CKRANGE in CR30. The jitter and spectral properties of this clock have a direct impact on the DAC and ADC performance because it is used to directly or by integer division drive the continuous-time to sampled-time interfaces.

Note that AMCK clock does not need to have any relation to any other digital or analog input or output.

AMCK can be either a square wave or a sinewave, bit AMCKSIN in CR30 selects the proper input mode. When a sinewave is used as input, AMCK pin must be decoupled with a capacitor. Specification for sinusoid input can be found in *Section 10.2 on page 62*.

The AMCK clock is not needed when only analog functions are used. For this purpose an internal oscillator with no external components can be used to operate the device (see *Section 4.14 on page 25*).

4.6 Data rates

STw5098 supports any data rate in 2 ranges: 8 kHz to 48 kHz and 88 kHz to 96 kHz. The range is selected with bits DA96K and AD96K in CR29 for AD and DA paths respectively.

Note: When AD96K=1 it is required to have DA96K=1.

The rates are fully independent in A/D and D/A paths. Moreover the rates do not have to be specified to the device and they can change on the fly, within one range, while data is flowing.

The 2 audio data interfaces (for A/D and D/A) can independently operate in master or slave modes.

4.7 Clock generators and master mode function

STw5098 provides 4 internal clock generators that can drive, if needed, the audio interfaces (master mode), and/or two independent master clocks.

The AMCK clock input frequency is internally raised via a PLL on each entity to obtain a clock (MCK) in the range 32 MHz to 48 MHz. The ratio MCK/AMCK is defined in CR30 (see MCKCOEFF in *Section 4.7 on page 20*).

MCK is used to obtain, by fractional division, the oversampled clock (OCK), word clock (SYNC) and bit clock (CK), that will therefore have edges aligned with MCK (the OCK period can have jitter of 1 MCK period).

The frequency of OCK, SYNC and CK is set with DAOCKF in CR21/20 for DA interface, and ADOCKF in CR24/23 for AD interface.

The ratio between OCK and SYNC clocks is selected with bit DAOCK512 in CR22 for DA interface and bit ADOCK512 in CR25 for AD interface. The ratio between CK and SYNC clocks depends on the selected interface format (see *Audio digital interfaces* paragraph below). Note that SPI format can only be slave.

The ADOCK and DAOCK output clocks are activated by bits ENADOCK and ENDAOCK respectively, while master mode generation is activated with two bits: first ADMAST (DAMAST) sets ADSYNC and ADCK (DASYNC and DACK) pins as outputs, then ADMASTGEN (DAMASTGEN) generates the SYNC and CK clocks. The logical value at SYNC and CK pins before data generation depends on the interface selected format.

See description of CR20 to CR25 for further details.

4.8 Audio digital interfaces

Four separate audio data interfaces are provided for AD and DA paths to have maximum flexibility in communicating with other devices. The 4 interfaces can have different rates and can work in different formats and modes (i.e an AD interface can be 8 kHz PCM slave while a DA is 44.1 kHz I^2S master).

The pins used by the interfaces are:
AD_SYNC, AD_CK and AD_DATA for AD paths word clock, bit clock and data, respectively, and
DA_SYNC, DA_CK and DA_DATA for DA paths word clock, bit clock and data, respectively.

Data is exchanged with MSB first and left channel data first in all formats. Data word-length is selected with bits DAWL in CR26 and ADWL in CR27. AD_DATA pin, outside the selected time slot, is in the impedance condition selected by bit ADHIZ in CR28 in all data formats except right aligned format.

In the following paragraphs SYNC, CK and DATA will be used when the distinction between AD and DA is not relevant. When Master Mode is selected (bits DAMAST and ADMAST in CR22 and CR25 respectively) the SYNC and CK clocks are generated internally. In addition, an oversampled clock can be generated for each interface (AD_OCK and DA_OCK). The clock is available in Slave Mode also, if needed.

The AD and DA interfaces can also be used as a single bidirectional interface when they are configured with the same format (Delayed, DSP, etc.) and AD_SYNC is connected to DA_SYNC and DA_CK to AD_CK. Master Mode is still available selecting ADMAST or DAMAST (not both).

The interfaces features are controlled with control registers CR26, CR27 and CR28.

Supported operating formats:

- **Delayed format (I^2S compatible)** (DAFORM or ADFORM =000): the Audio Interface is I^2S compatible (*Figure 9 on page 54*). The number of CK periods within one SYNC period is not relevant, as long as enough CK periods are used to transfer the data and the maximum frequency limit specified for bit clock is not exceeded. CK can be either a continuous clock or a sequence of bursts. In master mode there are 32 CK periods per SYNC period (that means 16 CK periods per channel) when the word length is 16 bit, while there are 64 CK periods per SYNC period (or 32 CK periods per channel) when word length is 18bit or higher. Bits ADSYNCP, DASYNCP and ADCKP, DACKP affect the interface format inverting the polarity of SYNC and CK pins respectively.
- **Left aligned format** (DAFORM or ADFORM =001): this format is equivalent to delayed format without the 1 bit clock delay at the beginning of each frame (*Figure 9 on page 54*).
- **Right aligned format** (DAFORM or ADFORM =010): this format is equivalent to delayed format, except that the audio data is right aligned and that the number of CK periods is fixed to 64 for each SYNC period (*Figure 9 on page 54*).
- **DSP format** (DAFORM or ADFORM =011) in this format the audio interface starting from a frame sync pulse on SYNC receives (DA) or sends (AD) the left and right data one after the other (*Figure 10 on page 55*). The number of CK periods within one SYNC period is not relevant, as long as enough CK periods are used to transfer the data and the maximum frequency limit specified for bit clock is not exceeded. CK can be either a continuous clock or a sequence of bursts. In Master Mode there are 32 CK periods per SYNC period when the word length is 16 bit, while there are 64 CK periods per SYNC period when word length is 18bit or higher. Bit CKP (ADCKP and DACKP)

affects the interface format inverting the polarity of CK pin. Bit SYNCP (ADSYNCP and DASYNCP) switches between delayed (SYNCP=0) and non delayed (SYNCP=1) formats.
DSP format is suited to interface with a multi-channel serial port.

- **SPI format** (DAFORM or ADFORM =100) in this format left and right data is received with separate data burst. Every burst is identified with a low level on SYNC signal (*Figure 10 on page 55*). There is no timing difference between the left and right data burst: the two channels are identified by the startup order: the first burst after AD path or DA path power-up identifies the left channel data, the second one is the Right channel data, then left and right data repeat one after the other. CK must have 16 periods per channel in case of 16 bit data word and 32 periods per channel in case of 18 bit to 32 bit data word.
  The SPI interface can be configured as a single-channel (mono) interface with bit SPIM (ADSPIM and DASPIM). The mono interface always exchanges the left channel sample.
  SPI-format can only be slave: if Master Mode is selected the CK and SYNC pins are set to 0. Bit CKP (ADCKP and DACKP) affects the interface format inverting the polarity of CK pin.
- **PCM format** (DAFORM or ADFORM =111): this format is monophonic, as it can only receive (DA) and transmit (AD) single channel data (*Figure 10 on page 55*). It is mainly used when voice filters are selected. If audio filters are used then the same sample is sent from DA-PCM interface to both channel of DA path, and the left channel sample from AD path is sent to AD-PCM interface. If in the AD path the right channel has to be sent to the PCM interface then the following must be set: ADRTOL=1 (CR27) and ENADCR=0 (CR1). In Master Mode the number of CK periods per SYNC period is between 16 and 512 (see DAPCMF in CR22 and ADPCMF in CR25 *Section 4.7 on page 20* for details). Bit CKP (ADCKP and DACKP) affects the interface format inverting the polarity of CK pin. Bit SYNCP (ADSYNCP and DASYNCP) switches between delayed (SYNCP=0) and non delayed (SYNCP=1) formats.

4.9 Analog inputs

Each entity of the STw5098 has a stereo Microphone preamplifier and a stereo Line In amplifier, with inputs selectable among 5: MIC (for Microphone preamplifiers only), LINEIN (for Line In amplifiers only) and 3 different AUX inputs (for Microphone and Line In amplifiers). The AUX inputs can be used simultaneously for Line In amplifiers and Microphone preamplifiers.

The following description is for one entity, it is similar for the other entity.

- **Microphone preamplifier:** it has a very low noise input, specifically designed for low amplitude signals. For this reason the preamplifier has a high input gain (up to 39 dB) keeping a constant 50 kΩ input impedance for the whole gain range. However it can also be used as line in preamplifier because it can accept a high dynamic input signal (up to 4 V_{pp}). There are two separate gain and attenuation stages in order to improve the S/N ratio when the preamplifier output range is below full scale (volume control).The gain and attenuation controls are separate for left and right channel (CR3 and CR4 respectively). The Preamplifier input is selected with bits MICSEL in CR18, and it is disconnected when MICMUTE=1. If a single ended input is selected then the preamplifier uses the selected pin as the positive input and connects the negative input (for both left and right channels) to CAPMIC pin, which has to be connected through a capacitor to a low noise ground (typically the same reference ground of the input).

Each stereo Microphone preamplifier is powered up with bits ENMICL and ENMICR in CR1.

- **Line In amplifier:** each line in amplifier is designed for high level input signal. The input gain is in the range -20 dB up to 18 dB. The Line In amplifier input is selected with bits LINSEL in CR18, and it is disconnected when LINMUTE=1. If a single ended input is selected then the amplifier uses the selected pin as the positive input and connects the negative input (for both left and right channels) to CAPLINEIN pin, which has to be connected through a capacitor to a low noise ground (typically the same reference ground of the input).
  The stereo Line In amplifier is powered up with bits ENLINL and ENLINR in CR1.

4.10 Analog output drivers

Each entity of the STw5098 provides 3 different analog signal outputs and 1 common mode reference output. The description here below is for one entity. V_{CCP} and V_{CCL} are common for both entities.

- **Line out drivers:** it is a stereo differential output, it can be used as single-ended output just by using the positive or negative pin. It can drive 1 kΩ resistive load. The load can be connected between the positive and negative pins or between one pin and ground through a decoupling capacitor. The output gain is regulated with LOG bits in CR7, in the range 0 to -18 dB, simultaneously for left and right channels. When used as a single ended output the effective gain is 6 dB lower. It is muted with bit MUTELO in CR19. The input signal of this stereo output can come from the analog mixer or directly from MIC preamplifiers. The output Common Mode Voltage level is controlled with bits VCML in CR19. The supply voltage of line out drivers is V_{CCP}.
  The line out drivers are powered up with bits ENLOL and ENLOR in CR1. The output pins are in high impedance state with a 180kΩ pull-down resistor when the line out drivers are powered down.
- **Headphones drivers:** it is a stereo single ended output. It can drive 16 ohm resistive load and deliver up to 40 mW. The output gain is regulated with HPLG and HPRG bits in CR8 and CR9 respectively, with a range of -40 to 6 dB. It is muted with bit MUTEHP in CR19. The input signal of this stereo output comes from the analog mixer.The output common mode voltage is controlled with bits VCML in CR19. The supply voltage of headphones drivers is V_{CCP}.
  The headphones drivers are powered up with bits ENHPL and ENHPR in CR2.The output pins are in high impedance state when the headphones drivers are powered down.
- **Common mode voltage driver:** it is a single ended output with output voltage value selectable with bits VCML in CR19, from 1.2 V to 1.65 V in steps of 150 mV. The output voltage should be set to the value closest to $V_{CCP}/2$ to optimize output drivers performance. The common mode voltage driver is designed to be connected to the common pin of stereo headphones, so that decoupling capacitors are not needed at HPL and HPR outputs. The supply voltage of the common mode voltage driver is V_{CCP}.
  The common mode voltage driver is powered up with bit ENHPVCM in CR2.The output pin is in high impedance state when the common mode voltage driver is powered down.

- **Loudspeaker driver (one entity only):** it is a monophonic differential output. It can drive 8 Ω resistive load and deliver up to 500 mW to the load. The output gain is regulated with LSG bits in CR7, in the range -24 to +6 dB. The input signal of the loudspeaker driver comes from the analog mixers: bits LSSEL in CR29 select left channel, right channel, (L+R)/2 (mono) or mute. The output common mode voltage is obtained with an internal voltage divider from V_{CCLS} and it is connected to CAPLS pin. The supply voltage of the loudspeaker driver is V_{CCLS}.
  The loudspeaker driver is powered up with bit ENLS in CR2.The output pin is in high impedance state when the loudspeaker driver is powered down.

Note: 1 Together with the LS driver, only a second power output is allowed among:
Ear (1EARP - 1EARN)
Headphones 1 (1HPL and 1HPR)
Headphones 2 (2HPL and 2HPR)

- **Earphone driver (one entity only):** it is a monophonic differential output. It can drive 32 Ω resistive load and deliver up to 125 mW to the load. The output gain is regulated with EARG bits in CR7, in the range -24 to +6 dB. The input signal of the loudspeaker driver comes from the analog mixers: bits EARSEL in CR29 select left channel, right channel, (L+R)/2 (mono) or mute. The output Common Mode Voltage is obtained with an internal voltage divider from V_{CCLS} and it is connected to CAPEAR pin. The supply voltage of the loudspeaker driver is V_{CCLS}.
  The loudspeaker driver is powered up with bit ENEAR in CR2.The output pin is in high impedance state when the loudspeaker driver is powered down.

Note: ***Note on direct connection of V_{CCLS} to the battery:***
The voltage of batteries of handheld devices during charging is usually below 5.5 V, making V_{CCLS} supply pin suitable for a direct connection to the battery. In this case if STw5098 is delivering the maximum power to the load and the ambient temperature is above 70 °C then the simultaneous charging of the battery can overheat the device. A basic protection scheme is implemented in STw5098 (activated with bit LSLIM in CR19): it limits the maximum gain of the loudspeaker to -6 dB when V_{CCLS} is above 4.2 V, and it removes the limit for V_{CCLS} below 4.0 V. The loudspeaker gain is left unchanged if it is set below -6 dB with bits LSG. This event (V_{CCLS} > 4.2 V) can generate, if enabled (bit VLSMSK in CR31), an IRQ signal.

4.11 Analog mixers

STw5098 can send to the output drivers the sum of stereo audio signals from 3 different sources of each entity: DA path (bit MIXDAC in CR17), Microphone Preamplifiers (bit MIXMIC in CR17) and Line In Amplifiers (bit MIXLIN in CR17). The analog mixers do not have a gain control on the inputs, therefore the user should reduce the levels of the input signals within the analog signal range.
The stereo analog mixers are powered up with bits ENMIXL and ENMIXR in CR2.

4.12 AD paths

In each entity the AD path converts audio signals from Microphone Preamplifiers (selected with bit ADMIC in CR17) and Line In Amplifiers (bit ADLIN in CR17) inputs to digital domain. If both inputs are selected then the sum of the two is converted. After AD conversion the audio data is resampled with a sample rate converter and then processed with the internal DSP. Two different filters are selectable in the DSP (bit ADVOICE in CR29): stereo Audio

Filter, with DC offset removal and FIR image filtering; and a standard mono voice-channel filter (uses left channel input and feeds both channel output). The AD path includes a digital gain control (ADCLG, ADCRG in CR12 and CR13 respectively) in the range -57 to +8 dB. The maximum gain from Mic Preamplifier to AD interface is then 47 dB. When Audio filter is selected in both AD and DA paths then DA audio data can be summed to AD data and sent to the AD Audio Interface (see DA2ADG in CR15). Left and right channels can be independently switched on and off to save power, if needed (bits ENADCL and ENADCR in CR1)

4.13 DA paths

In each entity the DA path converts digital data from the digital audio interface to analog domain and feeds it to the analog mixer. Incoming audio data is processed with a DSP where different filters are selectable (bit DAVOICE in CR29): Audio filter, stereo, with FIR image filtering, bass and treble controls (bits BASS and TREBLE in CR14), de-emphasis filter; and a standard voice channel filter, mono (uses left channel input and feeds both channel output). A dynamic compression function is available for both audio and voice filters (bit DYNC in CR14). The DA path includes a digital gain control (DACLG, DACRG in CR10 and CR11 respectively) in the range -65 to 0 dB. AD to DA mixing (sidetone) can be enabled: see CR16 for details. Left and right channel can be independently switched on and off to save power, if needed (bits ENDACL and ENDACR in CR1).

4.14 Analog-only operations

Each entity from the STw5098 can operate without AMCK master clock if analog-only functions are used. It is possible to mix Microphone and Line In preamplifiers signals and listen through headphones, loudspeaker or send them to line-out. The analog-only operation is enabled with bit ENOSC in CR0. When ENOSC=1 the AD and DA paths cannot be used.

In Analog Mode, each of the two entities can handle two different stereo audio signals, so it can be used as a front end for an external voice codec that does not include microphone preamplifiers and power drivers: mic signal is sent through Microphone preamplifiers directly to line out drivers (Transmit path), while Receive signal is sent through Line In amplifiers to the selected power drivers.

4.15 Automatic Gain Control (AGC)

STw5098 provides a digital Automatic Gain Control in AD path for each entity. The circuit can control the input gain at MIC preamplifier, Line In amplifier or both (bits ENAGCMIC and ENAGCLIN in CR35). When one input is selected, the center gain value used for the input is fixed with bits MICLG, MICRG, LINLG and LINRG in CR3 to CR6 (like in normal operation), then the AGC circuit adds to all the gains a value in the range -10.5 dB to +10.5 dB (or, extended with bit AGCRANGE in CR35, -21 dB to 21 dB), in order to obtain an average level at the digital interface output in the range -6 dB to -30 dB (selected with bits AGCLEV in CR35). The AGC added gain acts directly in the input gain, to avoid input saturation and improve S/N ratio, so it cannot exceed the input gain range. When MIC and Line-In inputs are selected simultaneously the control is performed on the sum of the two, preserving the balance fixed with input gains. Different values for Attack and Decay constants can be selected, depending on the kind of signal the AGC has to control (i.e. voice, music). The

Attack and Decay time constants are related to the AD data rate (see bits AGCATT and AGCDEL in CR34).

4.16 Interrupt request: IRQ pins

On each entity of the STw5098, the interrupt request feature can signal to a control device the occurrence of particular events on each entity. Two control registers are used to choose the behavior of IRQ pin: the first is a Status/Event Register (CR32), where bits can represent the status of an internal function (i.e. a voltage is above or below a threshold) or an event (i.e. a voltage changed crossing a threshold); the second is a Mask Register (CR31) where if a bit in the mask is set to 1 then the corresponding bit in the Status/Event Register can affect IRQ pin status.

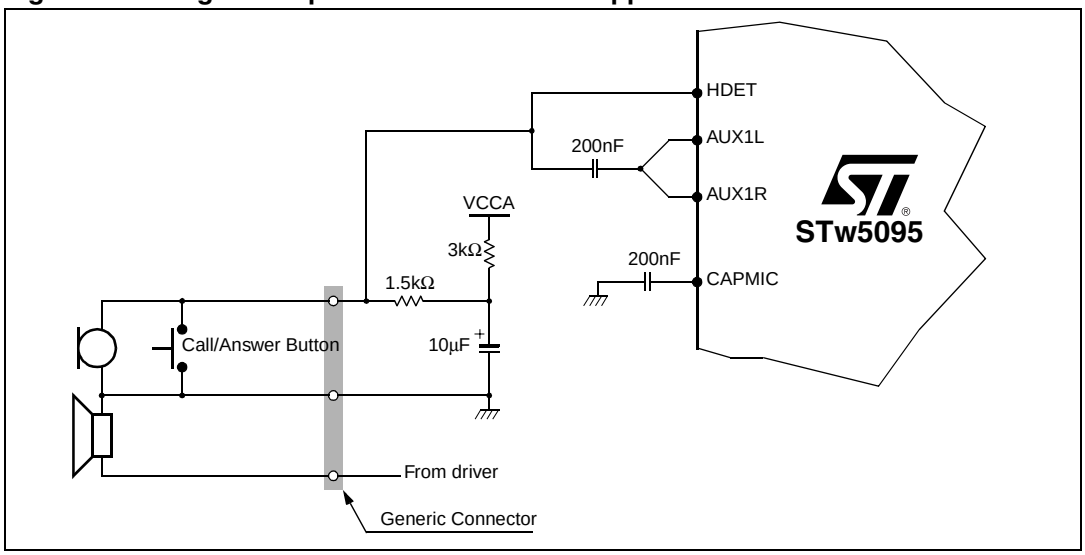
On each entity, the IRQ pin is always active low. At V_{CC} power up an interrupt request is generated by the Power-On-Reset circuit that sets to 1 bits PORMSK in CR31 and POREV in CR32. After this event the PORMSK bit should be cleared by the user and bit IRQCMOS in CR33 should be set according to the application (open drain or CMOS).

When an IRQ event occurs and SPI control interface is selected with no serial output pin it is still possible to identify the event (and relative status) that generated the interrupt request. This can be done by setting the IRQ mask/enable bits (in CR31) one at the time (with successive writings) and reading the IRQ pin status. A simple example of this is the headset plug-in detection: at first we set bit HSDETMSK=1 in CR31 (with all the other bits set to 0). If there is an interrupt request then we set HSDETMSK=0 and HSDETEN=1, so we can read the HSDET status at IRQ pin. Then we read CR32 to clear its content (even if no data is sent out).

4.17 Headset plug-in and push-button detection

Each entity of the STw5098 can detect the plug-in of a microphone connector and the press/release event of a call/answer push-button. An application example can be found below, while specifications can be found in *Section 10.4 on page 64*.

Figure 4. Plug-in and push-button detection application note



4.18 Microphone biasing circuits

The Microphone Biasing Circuits can drive mono or stereo microphones and can switch them off when not needed in order to save the current used by the microphone biasing network on each entity. Two bits control the behavior of the microphone bias circuit: MBIAS in CR17 enables the circuit (fixed voltage at MBIAS pin), while bit MBIASPD in CR17 affects the behavior of MBIAS pin when the function is not enabled. In particular when MBIASPD=1 the MBIAS pin is pulled down, otherwise it is left in tristate mode. The specification for the microphone biasing circuits can be found in *Section 10.6 on page 64*.

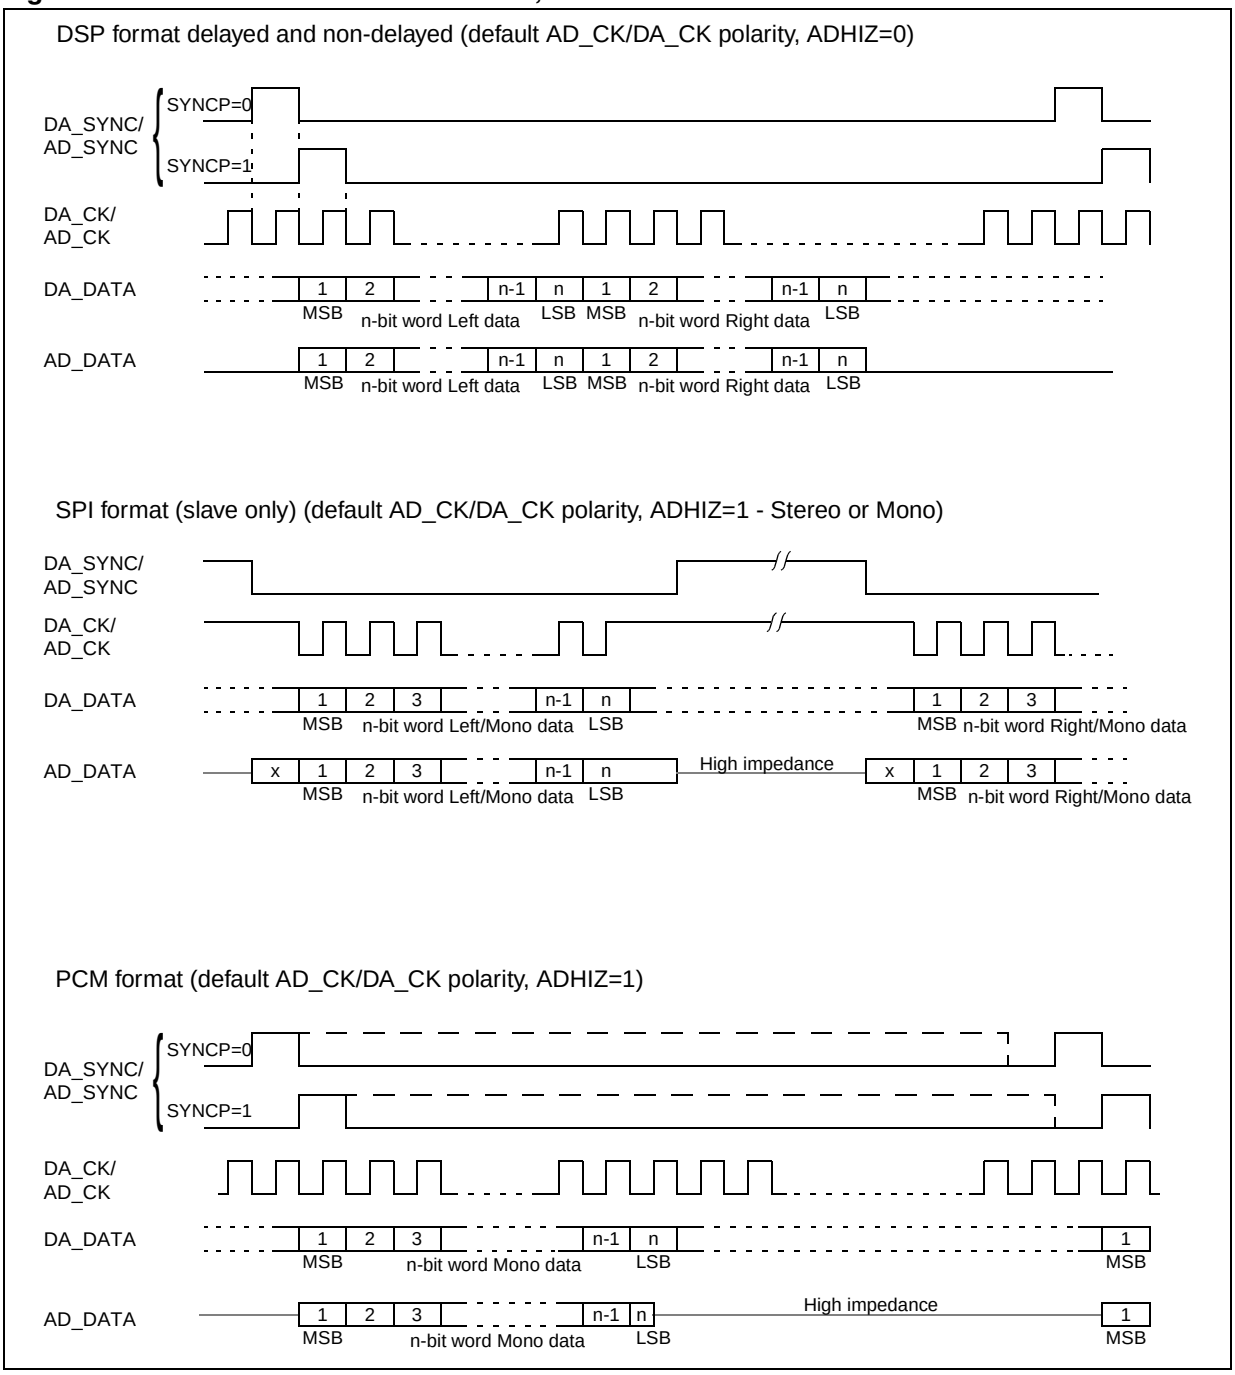

Figure 11. Audio interface timings: master mode

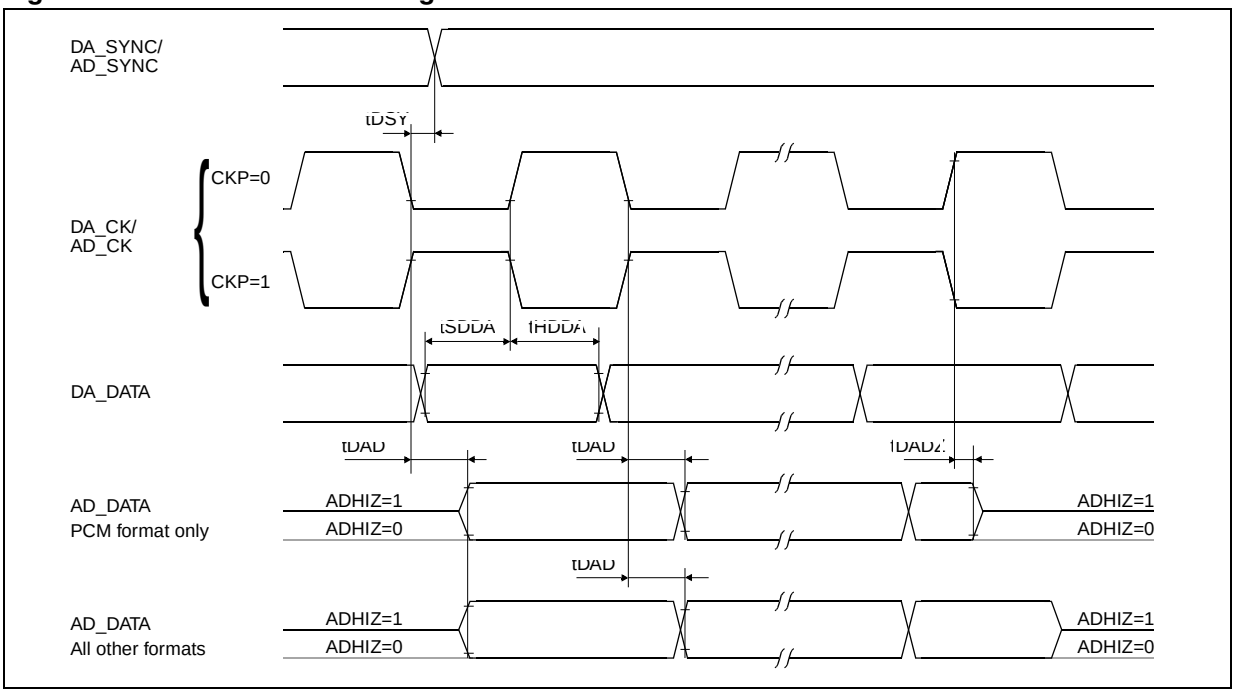

Figure 12. Audio interface timing: slave mode

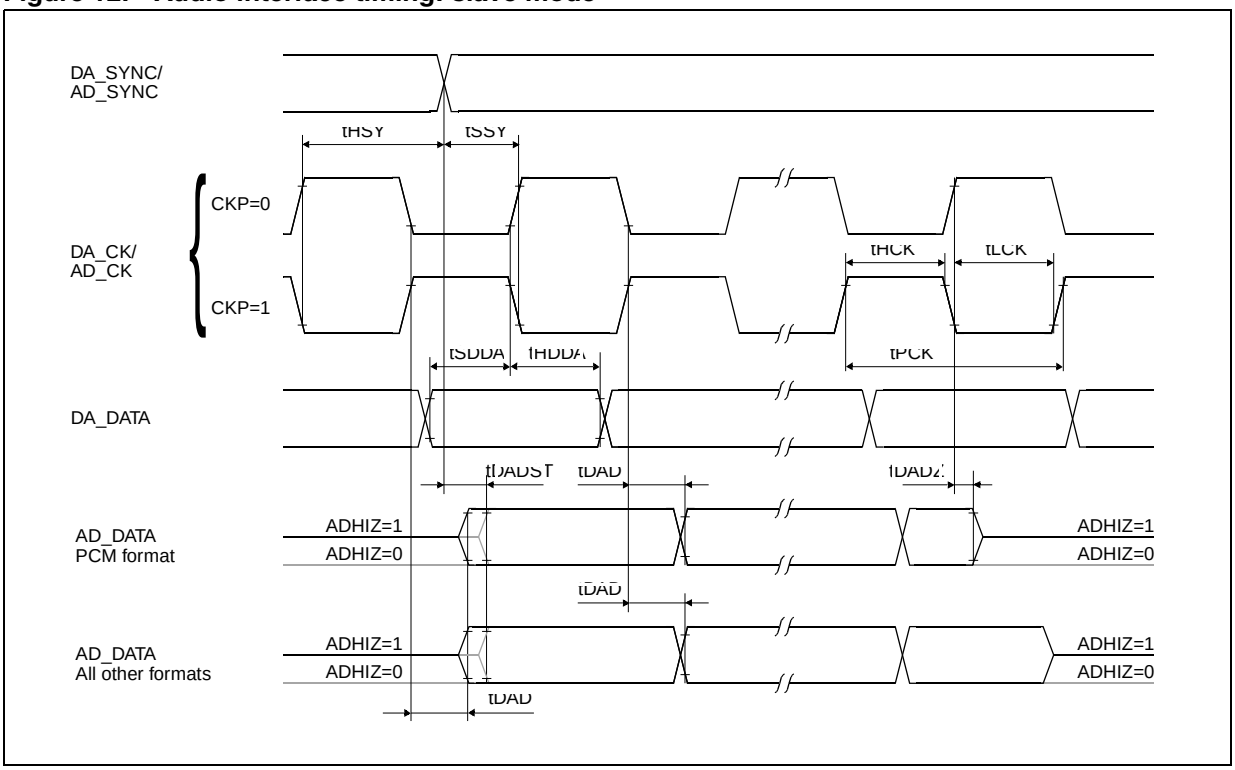

Table 33. Audio interface signal timings

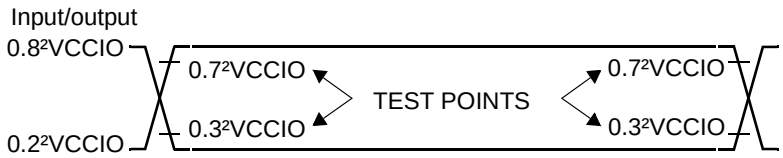
Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
t_{DSY}	Delay of AD_SYNC/DA_SYNC edge from AD_CK/DA_CK active edge	Master Mode			10	ns
t_{SDDA}	Setup time DA_DATA to DA_CK active edge		10			ns
t_{HDDA}	Hold time DA_DATA from DA_CK active edge		10			ns
t_{DAD}	Delay of AD_DATA edge from AD_CK active edge				30	ns
t_{DADST}	Delay of the first AD_DATA edge from AD_SYNC active edge	AD_SYNC active edge comes after AD_CK active edge			30	ns
t_{DADZ}	Delay of AD_DATA high impedance from AD_SYNC inactive edge	PCM format	10		50	ns
t_{SSY}	Setup time AD_SYNC/DA_SYNC to AD_CK/DA_CK active edge	Slave Mode	20			ns
t_{HSY}	Hold time AD_SYNC/DA_SYNC from AD_CK/DA_CK active edge	Slave Mode	20			ns
t_{PCK}	Period of AD_CK/DA_CK	Slave Mode	100			ns
t_{HCK}	AD_CK/DA_CK pulse width high	Measured from V_{IH} to V_{IH}	40			ns
t_{LCK}	AD_CK/DA_CK pulse width low	Measured from V_{IL} to V_{IL}	40			ns

8 Timing specifications

Information included in this section is valid for both entities.

Unless otherwise specified, V_{CCIO} = 1.71V to 2.7V, T_{amb} = -30°C to 85°C, max capacitive load 20 pF; typical characteristics are specified at V_{CCIO} = 2.4 V, T_{amb} = 25 °C; all signals are referenced to GND, see Note below figure for timing definitions.

Figure 13. A.C. testing input-output waveform



AC Testing: inputs are driven at 0.8•V_{CCIO} for a logic '1' and 0.2•V_{CCIO} for a logic '0'.
Timing measurements are made at 0.7•V_{CCIO} for a logic '1' and 0.3•V_{CCIO} for a logic '0'.

Note: A signal is valid if it is above V_{IH} or below V_{IL} and invalid if it is between V_{IL} and V_{IH}. For the purpose of this specification the following conditions apply (see Figure 13 above):
a) All input signal are defined as: V_{IL} = 0.2•V_{CCIO}, V_{IH} = 0.8•V_{CCIO}, t_R < 10ns, t_F < 10ns.
b) Delay times are measured from the inputs signal valid to the output signal valid.
c) Setup times are measured from the data input valid to the clock input invalid.
d) Hold times are measured from the clock signal valid to the data input invalid.

Note: All timing specifications subject to change.

9 Operative ranges

9.1 Absolute maximum ratings

Table 34. Absolute maximum ratings

Parameter	Value	Unit
V_{CC} or V_{CCIO} to GND	-0.5 to 3.6	V
V_{CCA} or V_{CCP} to GND	-0.5 to 5	V
V_{CCLS} to GND	-0.5 to 7	V
Voltage at analog inputs (V_{CCA} ≤3.3V)	GND-0.5 to V_{CCA}+0.5	V
Maximum power delivered to the load from LSP/N	500	mW
Peak current at HPR,HPL	100	mA
Current at V_{CCP}, V_{CCLS}, GNDP	350	mA
Current at any digital output	50	mA
Voltage at any digital input (V_{CCIO} ≤2.7V); limited at ± 50mA	GND-0.5 to V_{CCIO}+0.5	V
Storage temperature range	-65 to 150	°C
Operating temperature range(1)	-30 to 85	°C
Electrostatic discharge voltage (Vesd) Human body model(2) Charge device model(3)	 -2 to +2 -500 to +500	 kV V

1. in some operating conditions the temperature can be limited to 70 °C. See loudspeaker driver description from *Section 4.10* for details.
2. HBM tests have been performed in compliance with JESD22-A114-B and ESD STM 5.1-2001.HBM
3. CDM tests have been performed in compliance with CDM ANSI-ESDSTM5.3.1-1999

9.2 Operative supply voltage

Table 35. Operative supply voltage

Symbol	Parameter	Condition	Min.	Max.	Unit
V_{CC}	Digital supply		1.71	2.7	V
V_{CCA}	Analog supply Note: $V_{CCA} \geq V_{CC}$	A24V=0 (bit 1 in CR0) A24V=1 (bit 1 in CR0)	2.7 2.4	3.3 2.7	V V
V_{CCIO}	Digital I/O supply	D12V=0 (bit 0 in CR0) D12V=1 (bit 0 in CR0)	1.71 1.2	V_{CC} 1.8	V V
V_{CCP}	Stereo power drivers supply		V_{CCA}	3.3	V
V_{CCLS}	Mono power driver supply		V_{CCA}	5.5	V
V_G	Single supply voltage range	V_{CC}=V_{CCA}=V_{CCIO}=V_{CCP}=V_{CCLS} A24V=1 (bit 1 in CR0)	2.4	2.7	V

9.3 Power dissipation

Unless otherwise specified, V_{CCP} = V_{CCLS} = V_{CCA} = 2.7V to 3.3V, V_{CCIO} = V_{CC} = 1.71V to 2.7V, T_{amb} = -30°C to 85°C, all analog outputs not loaded; typical characteristics are specified at V_{CCIO} = V_{CC} = 1.8V, V_{CCP} = V_{CCLS} = V_{CCA} = 2.7V, T_{amb} = 25°C.

Table 36. Power dissipation

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
POFF	Power Down Dissipation	No Master Clock AMCK=13MHz		0.8 5.8		µW µW
PAD	Stereo ADC power			52.6		mW
PDA	Stereo DAC power			46.6		mW
PDAAD	Stereo ADC+DAC power			93.8		mW
PAA	Stereo Analog Path power			27.6		mW

9.4 Typical power dissipation by entity

T_{amb} = 25°C; Analog Supply: V_{CCP} = V_{CCLS} = V_{CCA} = 2.7V;
digital supply: V_{CCIO} = V_{CC} = 1.8V.
Full scale signal in every path, 20kΩ load at analog outputs.

No master clock

Table 37. Typical power dissipation, no master clock

10 Electrical characteristics

Unless otherwise specified, V_{CCIO} = 1.71V to 2.7V, T_{amb} = -30°C to 85°C; typical characteristic are specified at V_{CCIO} = 2.0V, T_{amb} = 25°C; all signals are referenced to GND.

10.1 Digital interfaces

Table 39. Digital interfaces specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{IL}	Input low voltage	All digital inputs DC AC			$0.3 \bullet V_{CCIO}$ $0.2 \bullet V_{CCIO}$	V V
V_{IH}	Input high voltage	All digital inputs, DC AC	$0.7 \bullet V_{CCIO}$ $0.8 \bullet V_{CCIO}$			V V
V_{OL}	Output low voltage	All digital outputs I_L = 10µA I_L = 2µA			0.1 0.4	V V
V_{OH}	Output high voltage	All digital outputs I_L = 10µA I_L = 2µA	V_{CCIO}-0.1 V_{CCIO}-0.4			V V
I_{IL}	Input low current	Any digital input, GND < V_{IN} < V_{IL}	-1		1	µA
I_{IH}	Input high current	Any digital input, V_{IH} < V_{IN} < V_{CCIO}	-1		1	µA
I_{OZ}	Output current in high impedance (Tristate)	Tristate outputs	-1		1	µA

Note: See Figure 13: A.C. testing input-output waveform on page 58.

10.2 AMCK with sinusoid input

Table 40. AMCK with sinusoid input specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
C_{AMCK}	Minimum External Capacitance	AMCKSIN=1, see CR30	100			pF
V_{AMCK}	AMCK sinusoidal voltage swing	AMCKSIN=1, see CR30	0.5		V_{CCIO}	V_{PP}

10.3 Analog interfaces

Information below is for each entity.

Table 41. Analog interface specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
I_{MIC}	MIC input leakage	GND< V_{MIC}< V_{CCA}	-100		+100	µA
R_{MIC}	MIC input resistance		30	50		kΩ
R_{LIN}	Line in input resistance		30			kΩ
R_{LHP}	Headphones (HP) drivers load resistance	HPL, HPR to GNDP or VCMHP	14.4	16/32		Ω
R_{LEAR}	Earphone (EAR) drivers load resistance	1 EARP to 1EARN	30	32		Ω
R_{LLS}	Loudspeaker (LS) drivers load resistance	2LSP to 2LSN	6.4	8		Ω
C_{LHP}	Headphones (HP) drivers load capacitance	HPL, HPR to GNDP or VCMHP			50 50*	pF nF
C_{LEAR}	Earphone (EAR) drivers load capacitance	1 EARP to 1EARN			50 50*	pF nF
C_{LLS}	Loudspeaker (LS) drivers load capacitance	2LSP to 2LSN			50 50*	pF nF
V_{OFFLS}	Differential offset voltage at 2LSP, 2LSN	R_L = 50Ω	-50		+50	mV
V_{OFFEAR}	Differential offset voltage at 1EARP, 1EARN	R_L = 50Ω	-50		+50	mV
R_{LOL}	Line out (OL) diff./single-ended driver load resistance	OLP/ORP to OLN/ORN or OLP/ORP to GND (decoupled)	1			kΩ

* with series resistor

10.4 Headset plug-in and push-button detector

Information below is for each entity.

Table 42. Headset plug-in and push-button detector specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
HD_{VL}	Plug-in detected	Voltage at HDET			V_{CCA}-1	V
HD_{VH}	Plug-in undetected	Voltage at HDET	V_{CCA}-0.5			V
HD_{H}	Plug-in detector hysteresis			100		mV
PB_{VL}	Push-button pressed	Voltage at HDET			0.5	V
PB_{VH}	Push-button released	Voltage at HDET	1			V
PB_{D}	Push-button de-bounce time		15		50	ms

10.5 Microphone bias

Information below is for each entity.

Table 43. Microphone bias specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{MBIAS}	MBIAS output voltage		1.95	2.1	2.25	V
I_{MBIAS}	MBIAS output current	From MBIAS to ground			1.1	mA
R_{MBIAS}	MBIAS output load		3.5			kΩ
C_{MBIAS}	MBIAS output capacitance				150	pF
PSR_{MB4} PSR_{MB20}	MBIAS power supply rejection	f<4kHz f<20kHz	60 50			dB dB

10.6 Power supply rejection ratio

Table 44. Power supply rejection ratio specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
PSR_{L20} PSR_{L200}	PSRR V_{CCLS}	Each output (LSP, LSN) f<20kHz f<200kHz		 65 47		 dB dB
PSR_{PH} PSR_{POS} PSR_{POD}	PSRR V_{CCP}	Headphones f<20kHz Line out single ended f<20kHz Line out differential f<20kHz		65 65 65		dB dB dB
PSR_{AM} PSR_{AL}	PSRR V_{CCA}	Mic input f<20kHz Line In f<20kHz		50 50		dB dB

10.7 LS and EAR gain limiter

Information below is for each entity.

Table 45. LS and EAR gain limiter

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
VLS_{LIMH}	High voltage at V_{CCLS} (VLSH=1)	V_{CCLS} raising		4.2		V
VLS_{LIML}	Low voltage at V_{CCLS} (VLSH=0)	V_{CCLS} falling		4.0		V
VLS_{LIMD}	V_{CCLS} Hysteresis			200		mV

Note: See CR32 for VLSH definition. See Loudspeaker driver description in *Section 4.10* for details.

11 Analog input/output operative ranges

Information included in this section applies to both entities.

11.1 Analog levels

Table 46. Reference full scale analog levels

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	0dBFS level	2.7V < V_{CCA} < 3.3V		12 4		dBV_{pp} V_{pp}
	0dBFS level low voltage mode	2.4V < V_{CCA} < 2.7V		10 3.18		dBV_{pp} V_{pp}

11.2 Microphone input levels

Analog supply range: 2.7 V < V_{CCA} < 3.3 V

Table 47. Microphone input levels, absolute levels at pins connected to preamplifiers

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Overload level, single ended	MIC gain = 0 to 6dB		707 2 -6		mV_{RMS} V_{pp} dBFS
	Overload level, single ended, versus MIC gain	MIC gain > 6dB	–(MIC_Gain)			dBFS
	Overload level, differential	MIC gain = 0dB		1.41 4 0		mV_{RMS} V_{pp} dBFS
	Overload level, differential, versus MIC gain	MIC gain > 0dB	–(MIC_Gain)			dBFS

Note: When 2.4 V < V_{CCA} < 2.7 V, voltage values are reduced by 2dB.

Table 48. Microphone input levels, absolute levels at pins connected to the line-in amplifiers

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Overload level, single ended	Line in gain from -20dB to 6dB		707 2 -6		mV_{RMS} V_{pp} dBFS
	Overload level (single ended) versus line in gain	Line in gain > 6dB	–(Line_In_Gain)			dBFS
	Overload level (differential)	Line in gain from -20dB to 0dB		1.41 4 0		mV_{RMS} V_{pp} dBFS

Table 48. Microphone input levels, absolute levels at pins connected to the line-in amplifiers

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Overload level (differential) versus line in gain	Line in gain > 0dB		–(Line_In_Gain)		dBFS

Note: When 2.4 V < V_{CCA} < 2.7 V, the values are reduced by 2dB

11.3 Line output levels

Analog supply range: 2.7 V < V_{CCA} < 3.3 V

Table 49. Absolute levels at OLP/OLN, ORP/ORN

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Output level, single ended	0 dB gain Full scale digital input		707 2 -6		mV_{RMS} V_{pp} dBFS
	Output level, differential	0 dB gain Full scale digital input		1.41 4 0		mV_{RMS} V_{pp} dBFS

Note: When 2.4 V < V_{CCA} < 2.7 V, the values are reduced by 2dB

11.4 Power output levels HP

Analog supply range: 2.7 V < V_{CCA} < 3.3 V

Table 50. Absolute levels at HPL - HPR

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Output level	-6dB gain Full scale digital input		707 2 -6		mV_{RMS} V_{pp} dBFS
	Max output power(1)	16 Ω load V_{CCP} > 3.2 V	40			mW

1. In some operating conditions the maximum output power can be limited. See "*Section 9.1: Absolute maximum ratings*" and "loudspeaker driver" description from *Section 4.10: Analog output drivers* for details.

Note: When 2.4 V < V_{CCA} < 2.7 V, the values are reduced by 2dB

11.5 Power output levels LS and EAR

Analog supply range: 2.7 V < V_{CCA} < 3.3 V

Table 51. Absolute levels at 1EARP-1EARN and 2LSP - 2LSN

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
	Output level	0 dB gain Full scale digital input		1.41 4 0		V_{RMS} V_{pp} dBFS
	Max EAR output power	32 Ω load V_{CCLS} > 4V	125			mW
	Max LS output power(1)	8 Ω load V_{CCLS} > 4V	500			mW

1. In some operating conditions the maximum output power can be limited. See "*Section 9.1: Absolute maximum ratings*" and "loudspeaker driver" description from *Section 4.10: Analog output drivers* for details.

Note: When 2.4 V < V_{CCA} < 2.7 V, the values are reduced by 2dB

12 Stereo audio ADC specifications

Information included in this section applies to both entities. Typical measures at V_{CCA}=V_{CCP}=V_{CCLS}=2.7V; V_{CCIO}=V_{CC}=1.8 V; Tamb=25° C;13 MHz AMCK

Table 52. Stereo audio ADC specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
ADN	Resolution				20	Bits
ADDRM ADDRLI	Dynamic range	20Hz to 20kHz, A-weighted Measured at -60dBFS MIC input, 21dB gain Line-In, 0dB gain	 87 89	 91 93		 dB dB
ADSNA ADSN	Signal to noise ratio	Max level at MIC input, 21dB gain A-weighted Unweighted (20 Hz to 20 kHz)		 90 86		 dB dB
	Input referred ADC noise	A-weighted Mic input 0dB gain Mic input 21dB gain Mic input 39dB gain Line in input 0dB gain Line in input 18dB gain		 37 3.3 1.9 30 7.5		 µV µV µV µV µV
ADTHD	Total harmonic distortion	Max level at MIC input, 21dB gain		0.001	0.003	%
	Deviation from linear phase	Measurement bandwidth 20Hz to 20kHz, Fs= 48kHz. Combined digital and analog filter characteristics			1	Deg
ADf_{PB}	Passband	Combined digital and analog filter characteristics AD96K=0	0		0.45Fs	kHz
	Passband ripple	Combined digital and analog filter characteristics AD96K=0			0.2	dB
ADf_{SB}	Stopband	Combined digital and analog filter characteristics AD96K=0	0.55Fs			kHz
	Stopband Attenuation	Measurement bandwidth up to 3.45Fs. Combined digital and analog filter characteristics, AD96K=0	60			dB
ADt_{gd}	Group delay	Audio filters, 96kHz FS Audio filters, 48kHz FS Audio filters, 8kHz FS		0.11 0.4 2.6		ms ms ms
	Interchannel isolation			90		dB
	Interchannel gain mismatch				0.2	dB
	Gain error				0.5	dB

Note: When 2.4 V < V_{CCA} < 2.7 V, the values are reduced by 2dB

13 Stereo audio DAC specifications

Information included in this section applies to both entities.
Typical measures at V_{CCA}=V_{CCP}=V_{CCLS}=2.7V; V_{CCIO}=V_{CC}=1.8V; Tamb=25° C;13MHz AMCK

Table 53. Stereo audio DAC specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
DAN	Resolution				20	Bits
DADR	Dynamic range	20Hz to 20kHz, A-weighted. Measured at -60dBFS Differential line out Single-ended line out HPL/HPR to GND or VCMHP LSP-LSN	90	 95 93 94 94		 dB dB dB dB
DASNA DASN	Signal to noise ratio	2Vpp output HPL, HPR gain set to -6dB, 16Ω load A-weighted Unweighted (20 Hz to 20 kHz)		 94 90		 dB dB
DATHDL	Total harmonic distortion Worst case load	$2V_{pp}$ output HPL, HPR gain set to -6dB, 16Ω load		0.02	0.04	%
DATHD	Total harmonic distortion	$2V_{pp}$ output, HPL, HPR gain set to -6dB, 1kΩ load		0.004		%
	Deviation from linear phase	Measurement bandwidth 20Hz to 20kHz, Fs= 48kHz. Combined digital and analog filter characteristics			1	Deg
DAf_{PB}	Passband	Combined digital and analog filter characteristics, DA96K=0	0		0.45Fs	kHz
	Passband ripple	Combined digital and analog filter characteristics, DA96K=0			0.2	dB
DAf_{SB}	Stopband	Combined digital and analog filter characteristics, DA96K=0	0.55Fs			kHz
	Stopband attenuation	Measurement bandwidth up to 3.45Fs. Combined digital and analog filter characteristics, DA96K=0	50			dB
TSF	Transient suppression filter cut-off frequency		15		23	Hz
	Out of band noise	Measurement bandwidth 20 kHz to 100 kHz. Zero input signal		-85		dBr

Table 53. Stereo audio DAC specifications (continued)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
DAt_{gd}	Group delay	Audio filters, 96kHz FS Audio filters, 48kHz FS Audio filters, 8kHz FS		0.09 0.4 2.6		ms ms ms
	Interchannel isolation	2Vpp output HPR, HPL unloaded HPR, HPL with 16Ω to VCMHP		100 60		dB dB
	Interchannel gain mismatch				0.2	dB
	Gain error				0.5	dB
SUT	Startup time from power up	FS=48 kHz Line out HPL/R out		1 10		ms ms

Note: When 2.4 V < V_{CCA} < 2.7 V, values are reduced by 2 dB

14 AD to DA mixing (sidetone) specifications

Information included in this section applies to both entities.

Typical measures at V_{CCA}=V_{CCP}=V_{CCLS}=2.7V; V_{CCIO}=V_{CC}=1.8V; Tamb=25° C;13MHz AMCK.

Table 54. AD to DA mixing (sidetone) specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
STDEL	AD to DA mixing (sidetone) delay	Valid for audio and voice filters		5	10	µs

15 Stereo analog-only path specifications

Information included in this section applies to both entities.
Measured at differential line-out, ENOSC=1, No master clock.
Typical measures at V_{CCA}=V_{CCP}=V_{CCLS}=2.7V; V_{CCIO}=V_{CC}=1.8V; Tamb=25° C

Table 55. Stereo analog-only path specifications

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
AADRM AADRLI	Dynamic range	20Hz to 20kHz, A-weighted. Measured at -60dBFS				
		MIC input, 21dB gain	90	95		dB
		Line-In, 0dB gain	90	97		dB
AASNA AASN	Signal to noise ratio	Max level at line-in input, 0dB gain,				
		A-weighted		97		dB
		Unweighted (20 Hz to 20 kHz)		94		dB
AATHD	Total harmonic distortion	1kHz @ 0dBFS				
		MIC input, 21dB gain		0.003	0.01	%
		Line-in input, 0dB gain		0.004	0.02	%

Note: When 2.4V<V_{CCA}<2.7V, the values are reduced by 2dB.

16 ADC (TX) & DAC (RX) specifications with voice filters selected

Information included in this section applies to both entities.
Typical measures at $V_{CCA}=V_{CCP}=V_{CCLS}=2.7V$; $V_{CCIO}=V_{CC}=1.8V$; Tamb=25° C;13MHz AMCK

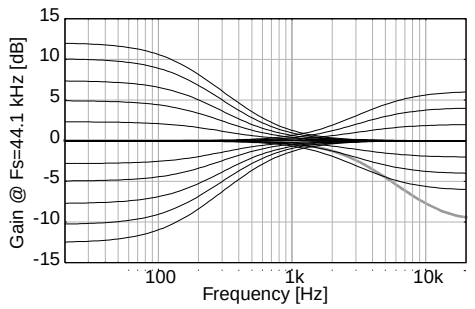
Table 56. ADC (TX) & DAC (RX) specifications with voice filters selected

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
		300Hz to 3.4kHz; 1kHz @ -60dBFS				
TXDR	Dynamic range	TX Path, MIC input, 21dB gain	86	89		dB
RXDR		RX Path, LS Output, 0dB gain	83	86		dB
		300Hz to 3.4kHz; 1kHz @ 0dBFS				
TXSN	Signal to noise ratio	TX Path, MIC input, 21dB gain		88		dB
RXSN		RX Path, LS and EAR outputs, 0dB gain		86		dB
		1kHz @ 0dBFS				
THD	THD	TX Path, MIC input, 21dB gain		<0.001		%
		RX Path, LS and EAR outputs, 0dB gain		0.005		%
		f=60Hz			-30	dB
		f=100Hz			-24	dB
		f=200Hz			-6	dB
		f=300Hz	-1.5		0.5	dB
TXG	TX gain mask	f=400Hz-3000Hz	-0.5		0.5	dB
		f=3400Hz	-1.5		0.0	dB
		f=4000H			-14	dB
		f=4600Hzz			-35	dB
		f=8000Hz			-47	dB
		f=60Hz			-20	dB
		f=100Hz			-12	dB
		f=200Hz			-2	dB
		f=300Hz	-1.5		0.5	dB
RXG	RX gain mask	f=400Hz-3000Hz	-0.5		0.5	dB
		f=3400Hz	-1.5		0.0	dB
		f=4000Hz			-14	dB
		f=5000Hz			-50	dB
	RX out of band noise	Measurement bandwidth 4kHz to 100kHz. Zero input signal		-85		dBr
	Group delay	TX path		0.32		ms
		RX path		0.28		ms

Note: When $2.4V<V_{CCA}<2.7V$, the values are reduced by 2dB

17 Typical performance plots

Figure 14. Bass treble control, de-emphasis filter



Bass and treble gains are independently selectable in any combination. The de-emphasis filter (thick line, alternative to treble control) compensates for pre-emphasis used on some audio CDs. Gain error < 0.1dB. Filter characteristics at Fs=44.1kHz are plotted

18 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.

ddd			0.08			0.08	
eee			0.15			0.15	*Note 4*
fff			0.05			0.05	*Note 5*

Note: 1 LFBGA stands for Low Profile Fine Pitch Ball Grid Array.
- Low profile: the total profile height (DIm A) is measured from the seating plane to the top of the component. The maximum total package height is calculated as follows:
$A2Typ + A1Typ + \sqrt{(A1^2 + A3^2 + A4^2 tolerancevalues)}$ *. Fine pitch: e<1.0 mm pitch*

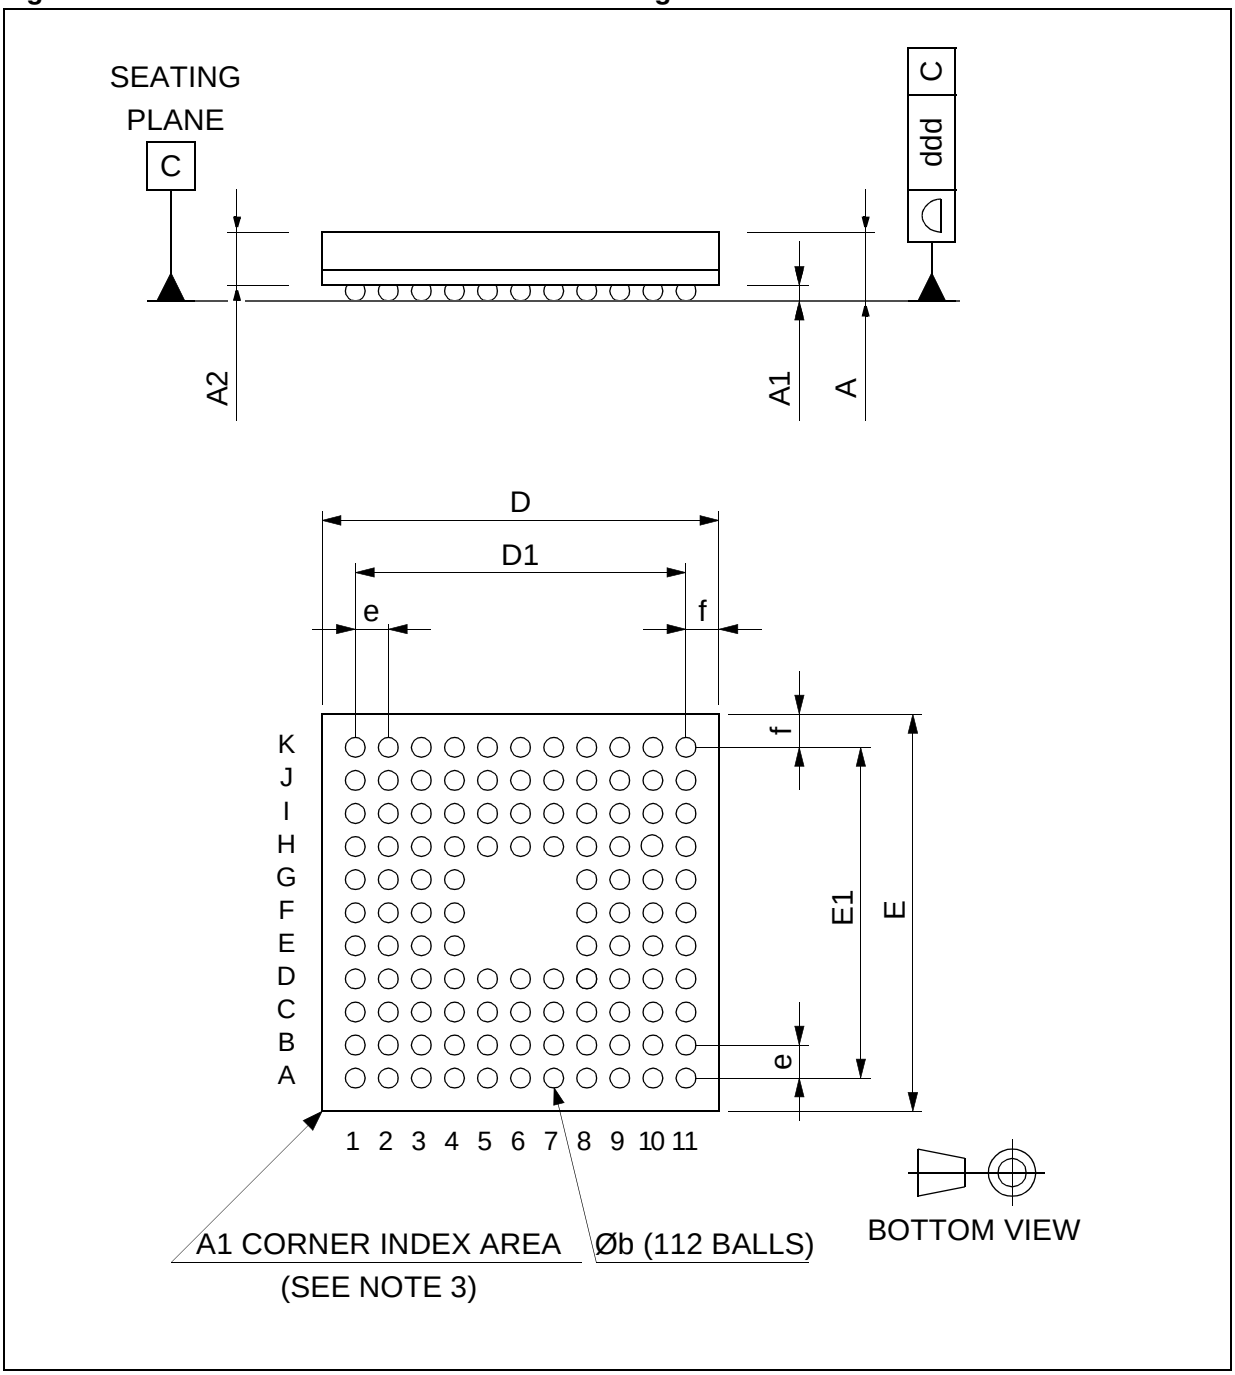
2 The typical ball diameter before mounting is 0.30 mm

3 The tolerance of position that controls the location of the pattern of balls with respect to datum A and B. For each ball there is a cylindrical tolerance zone eee perpendicular to datum C and located on true position with respect to datum A and B as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone.

4 The tolerance of position that controls the location of the balls within the matrix with respect to each other. For each ball there is a cylindrical tolerance zone fff perpendicular to datum C and located on true position as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone. Each tolerance zone fff in the array is contained entirely in the respective zone eee above.
The axis of each ball must lie simultaneously in both tolerance zones.

5 The terminal A1 corner must be identified on the top surface by using a corner chamfer, ink or metallized markings, or other feature of package body or integral heatslug. A distinguishing feature is allowable on the bottom surface of the package to identify the terminal A1 corner. Exact shape of each corner is optional.

Figure 32. LFBGA 6x6x1.4 112 4R11x11 0.5 drawing



18.2 VFBGA 5x5x1.0

eee			0.13			0.13	*Note 4*
fff			0.04			0.04	*Note 5*

Note: 1 VFBGA stands for Very thin Profile Fine Pitch Ball Grid Array.
The maximum total package height is calculated by the following methodology:
$A2Typ + A1Typ + \sqrt{(A1^2 + A3^2 + A4^2 tolerancevalues)}$.
Very thin profile: $0.80mm < A \leq 1.00mm$ *Max/Fine pitch: e<1.0 mm*

2 The typical ball diameter before mounting is 0.25 mm

3 VFBGA with 0.40mm ball pitch is not yet registered into JEDEC publications.

4 The tolerance of position that controls the location of the pattern of balls with respect to datum A and B. For each ball there is a cylindrical tolerance zone eee perpendicular to datum C and located on true position with respect to datum A and B as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone.

5 The tolerance of position that controls the location of the balls within the matrix with respect to each other. For each ball there is a cylindrical tolerance zone fff perpendicular to datum C and located on true position as defined by e. The axis perpendicular to datum C of each ball must lie within this tolerance zone. Each tolerance zone fff in the array is contained entirely in the respective zone eee above.
The axis of each ball must lie simultaneously in both tolerance zones.

6 The terminal A1 corner must be identified on the top surface by using a corner chamfer, ink or metallized markings, or other feature of package body or integral heatslug. A distinguishing feature is allowable on the bottom surface of the package to identify the terminal A1 corner. Exact shape of each corner is optional.
