F^{2}MC-16FX 16-bit Microcontroller

MB96650 series is based on Cypress's advanced F^{2}MC-16FX architecture (16-bit with instruction pipeline for RISC-like performance). The CPU uses the same instruction set as the established F^{2}MC-16LX family thus allowing for easy migration of F^{2}MC-16LX Software to the new F^{2}MC-16FX products. F^{2}MC-16FX product improvements compared to the previous generation include significantly improved performance - even at the same operation frequency, reduced power consumption and faster start-up time. For high processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 32MHz operation frequency from an external 4MHz to 8MHz resonator. The result is a minimum instruction cycle time of 31.2ns going together with excellent EMI behavior. The emitted power is minimized by the on-chip voltage regulator that reduces the internal CPU voltage. A flexible clock tree allows selecting suitable operation frequencies for peripheral resources independent of the CPU speed.

Features

Technology

0.18μm CMOS

CPU

- F^{2}MC-16FX CPU
- Optimized instruction set for controller applications (bit, byte, word and long-word data types, 23 different addressing modes, barrel shift, variety of pointers)
- 8-byte instruction queue
- Signed multiply (16-bit × 16-bit) and divide (32-bit/16-bit) instructions available

System clock

- On-chip PLL clock multiplier (×1 to ×8, ×1 when PLL stop)
- 4MHz to 8MHz crystal oscillator (maximum frequency when using ceramic resonator depends on Q-factor)
- Up to 8MHz external clock for devices with fast clock input feature
- 32.768kHz subsystem quartz clock
- 100kHz/2MHz internal RC clock for quick and safe startup, clock stop detection function, watchdog
- Clock source selectable from mainclock oscillator, subclock oscillator and on-chip RC oscillator, independently for CPU and 2 clock domains of peripherals
- The subclock oscillator is enabled by the Boot ROM program controlled by a configuration marker after a Power or External reset
- Low Power Consumption - 13 operating modes (different Run, Sleep, Timer, Stop modes)

On-chip voltage regulator

Internal voltage regulator supports a wide MCU supply voltage range (Min=2.7V), offering low power consumption

Low voltage detection function

Reset is generated when supply voltage falls below programmable reference voltage

Code Security

Protects Flash Memory content from unintended read-out

DMA

Automatic transfer function independent of CPU, can be assigned freely to resources

Interrupts

- Fast Interrupt processing
- 8 programmable priority levels
- Non-Maskable Interrupt (NMI)

CAN

- Supports CAN protocol version 2.0 part A and B
- ISO16845 certified
- Bit rates up to 1Mbps
- 32 message objects
- Each message object has its own identifier mask
- Programmable FIFO mode (concatenation of message objects)
- Maskable interrupt
- Disabled Automatic Retransmission mode for Time Triggered CAN applications
- Programmable loop-back mode for self-test operation

USART

- Full duplex USARTs (SCI/LIN)
- Wide range of baud rate settings using a dedicated reload timer

■ Special synchronous options for adapting to different synchronous serial protocols

■ LIN functionality working either as master or slave LIN device

■ Extended support for LIN-Protocol to reduce interrupt load

I²C

■ Up to 400kbps

■ Master and Slave functionality, 7-bit and 10-bit addressing

A/D converter

■ SAR-type

■ 8/10-bit resolution

■ Signals interrupt on conversion end, single conversion mode, continuous conversion mode, stop conversion mode, activation by software, external trigger, reload timers and PPGs

■ Range Comparator Function

■ Scan Disable Function

Source Clock Timers

Three independent clock timers (23-bit RC clock timer, 23-bit Main clock timer, 17-bit Sub clock timer)

Hardware Watchdog Timer

■ Hardware watchdog timer is active after reset

■ Window function of Watchdog Timer is used to select the lower window limit of the watchdog interval

Reload Timers

■ 16-bit wide

■ Prescaler with $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$ of peripheral clock frequency

■ Event count function

Free-Running Timers

■ Signals an interrupt on overflow, supports timer clear upon match with Output Compare (0, 4)

■ Prescaler with 1, $1/2^1$, $1/2^2$, $1/2^3$, $1/2^4$, $1/2^5$, $1/2^6$, $1/2^7$, $1/2^8$ of peripheral clock frequency

Input Capture Units

■ 16-bit wide

■ Signals an interrupt upon external event

■ Rising edge, Falling edge or Both (rising & falling) edges sensitive

Output Compare Units

■ 16-bit wide

■ Signals an interrupt when a match with Free-running Timer occurs

■ A pair of compare registers can be used to generate an output signal

Programmable Pulse Generator

■ 16-bit down counter, cycle and duty setting registers

■ Can be used as 2×8-bit PPG

■ Interrupt at trigger, counter borrow and/or duty match

■ PWM operation and one-shot operation

■ Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock or of selected Reload timer underflow as clock input

■ Can be triggered by software or reload timer

■ Can trigger ADC conversion

■ Timing point capture

■ Start delay

Quadrature Position/Revolution Counter (QPRC)

■ Up/down count mode, Phase difference count mode, Count mode with direction

■ 16-bit position counter

■ 16-bit revolution counter

■ Two 16-bit compare registers with interrupt

■ Detection edge of the three external event input pins AIN, BIN and ZIN is configurable

Real Time Clock

■ Operational on main oscillation (4MHz), sub oscillation (32kHz) or RC oscillation (100kHz/2MHz)

■ Capable to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)

■ Read/write accessible second/minute/hour registers

■ Can signal interrupts every half second/second/minute/hour/day

■ Internal clock divider and prescaler provide exact 1s clock

External Interrupts

■ Edge or Level sensitive

■ Interrupt mask bit per channel

■ Each available CAN channel RX has an external interrupt for wake-up

■ Selected USART channels SIN have an external interrupt for wake-up

Non Maskable Interrupt

■ Disabled after reset, can be enabled by Boot-ROM depending on ROM configuration block

- Once enabled, can not be disabled other than by reset

- High or Low level sensitive

- Pin shared with external interrupt 0

I/O Ports

- Most of the external pins can be used as general purpose I/O

- All push-pull outputs (except when used as I^2C SDA/SCL line)

- Bit-wise programmable as input/output or peripheral signal

- Bit-wise programmable input enable

- One input level per GPIO-pin (either Automotive or CMOS hysteresis)

- Bit-wise programmable pull-up resistor

Built-in On Chip Debugger (OCD)

- One-wire debug tool interface

- Break function:
  □ Hardware break: 6 points (shared with code event)
  □ -Software break: 4096 points

- Event function
  □ Code event: 6 points (shared with hardware break)
  □ -Data event: 6 points
  □ Event sequencer: 2 levels + reset

- Execution time measurement function

- Trace function: 42 branches

- Security function

Flash Memory

- Dual operation flash allowing reading of one Flash bank while programming or erasing the other bank

- Command sequencer for automatic execution of programming algorithm and for supporting DMA for programming of the Flash Memory

- Supports automatic programming, Embedded Algorithm

- Write/Erase/Erase-Suspend/Resume commands

- A flag indicating completion of the automatic algorithm

- Erase can be performed on each sector individually

- Sector protection

- Flash Security feature to protect the content of the Flash

- Low voltage detection during Flash erase or write
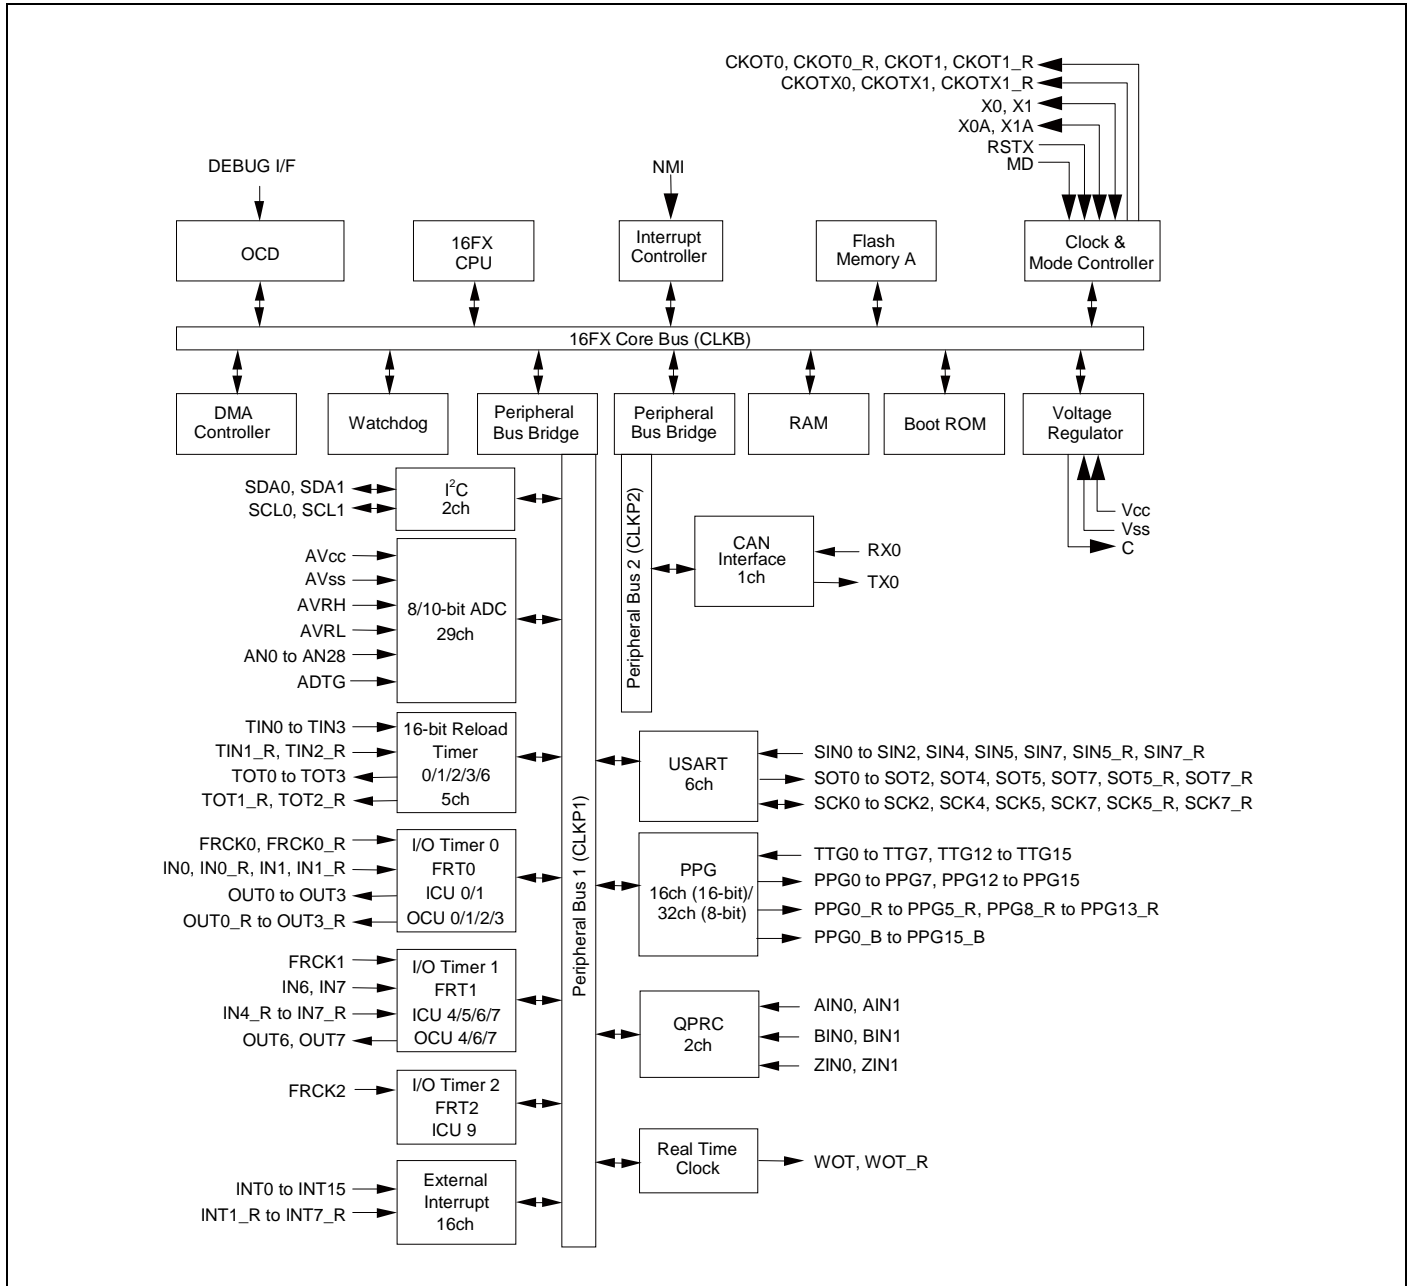

Contents

1. Product Lineup

Features		MB96650	Remark
Product Type		Flash Memory Product	
Subclock		Subclock can be set by software	
Dual Operation Flash Memory	RAM	-	
64.5KB + 32KB	10KB	MB96F653R, MB96F653A	Product Options
128.5KB + 32KB	16KB	MB96F655R, MB96F655A	R: MCU with CAN
256.5KB + 32KB	24KB	MB96F656R	A: MCU without CAN
384.5KB + 32KB	28KB	MB96F657R	
Package		LQFP-120 FPT-120P-M21	
DMA		4ch	
USART		6ch	LIN-USART 0 to 2/4/5/7
	with automatic LIN-Header transmission/reception	Yes (only 1ch)	LIN-USART 0
	with 16 byte RX- and TX-FIFO	No	
I²C		2ch	I²C 0/1
8/10-bit A/D Converter		29ch	AN 0 to 28
	with Data Buffer	No	
	with Range Comparator	Yes	
	with Scan Disable	Yes	
	with ADC Pulse Detection	No	
16-bit Reload Timer (RLT)		5ch	RLT 0 to 3/6
16-bit Free-Running Timer (FRT)		3ch	FRT 0 to 2
16-bit Input Capture Unit (ICU)		7ch (1 channel for LIN-USART)	ICU 0/1/4 to 7/9 ICU 9 for LIN-USART
16-bit Output Compare Unit (OCU)		7ch	OCU 0 to 4/6/7 (OCU 4 for FRT clear)
8/16-bit Programmable Pulse Generator (PPG)		16ch (16-bit) / 32ch (8-bit)	PPG 0 to 15
	with Timing point capture	Yes	
	with Start delay	Yes	
	with Ramp	No	
Quadrature Position/Revolution Counter (QPRC)		2ch	QPRC 0/1
CAN Interface		1ch	CAN 0 32 Message Buffers
External Interrupts (INT)		16ch	INT 0 to 15
Non-Maskable Interrupt (NMI)		1ch	
Real Time Clock (RTC)		1ch	
I/O Ports		99 (Dual clock mode) 101 (Single clock mode)	
Clock Calibration Unit (CAL)		1ch	
Clock Output Function		2ch	
Low Voltage Detection Function		Yes	Low voltage detection function can be disabled by software
Hardware Watchdog Timer		Yes	
On-chip RC-oscillator		Yes	
On-chip Debugger		Yes	

Note: All signals of the peripheral function in each product cannot be allocated by limiting the pins of package.
It is necessary to use the port relocate function of the general I/O port according to your function use.

2. Block Diagram

3. Pin Assignment

(Top view)

LQFP - 120

(FPT-120P-M21)

*1: CMOS input level only

*2: CMOS input level only for I^2C

*3: Please set ROM Configuration Block (RCB) to use the subclock.

Other than those above, general-purpose pins have only Automotive input level.
4. Pin Description

Pin name	Feature	Description
ADTG	ADC	A/D converter trigger input pin
AINn	QPRC	Quadrature Position/Revolution Counter Unit n input pin
ANn	ADC	A/D converter channel n input pin
AVcc	Supply	Analog circuits power supply pin
AVRH	ADC	A/D converter high reference voltage input pin
AVRL	ADC	A/D converter low reference voltage input pin
AVss	Supply	Analog circuits power supply pin
BINn	QPRC	Quadrature Position/Revolution Counter Unit n input pin
C	Voltage regulator	Internally regulated power supply stabilization capacitor pin
CKOTn	Clock Output function	Clock Output function n output pin
CKOTn_R	Clock Output function	Relocated Clock Output function n output pin
CKOTXn	Clock Output function	Clock Output function n inverted output pin
CKOTXn_R	Clock Output function	Relocated Clock Output function n inverted output pin
DEBUG I/F	OCD	On Chip Debugger input/output pin
FRCKn	Free-Running Timer	Free-Running Timer n input pin
FRCKn_R	Free-Running Timer	Relocated Free-Running Timer n input pin
INn	ICU	Input Capture Unit n input pin
INn_R	ICU	Relocated Input Capture Unit n input pin
INTn	External Interrupt	External Interrupt n input pin
INTn_R	External Interrupt	Relocated External Interrupt n input pin
MD	Core	Input pin for specifying the operating mode
NMI	External Interrupt	Non-Maskable Interrupt input pin
OUTn	OCU	Output Compare Unit n waveform output pin
OUTn_R	OCU	Relocated Output Compare Unit n waveform output pin
Pnn_m	GPIO	General purpose I/O pin
PPGn	PPG	Programmable Pulse Generator n output pin (16bit/8bit)
PPGn_R	PPG	Relocated Programmable Pulse Generator n output pin (16bit/8bit)
PPGn_B	PPG	Programmable Pulse Generator n output pin (16bit/8bit)
RSTX	Core	Reset input pin
RXn	CAN	CAN interface n RX input pin
SCKn	USART	USART n serial clock input/output pin
SCKn_R	USART	Relocated USART n serial clock input/output pin
SCLn	I^{2}C	I^{2}C interface n clock I/O input/output pin
SDAn	I^{2}C	I^{2}C interface n serial data I/O input/output pin
SINn	USART	USART n serial data input pin
SINn_R	USART	Relocated USART n serial data input pin
SOTn	USART	USART n serial data output pin
SOTn_R	USART	Relocated USART n serial data output pin
TINn	Reload Timer	Reload Timer n event input pin
TINn_R	Reload Timer	Relocated Reload Timer n event input pin

Pin name	Feature	Description
TOTn	Reload Timer	Reload Timer n output pin
TOTn_R	Reload Timer	Relocated Reload Timer n output pin
TTGn	PPG	Programmable Pulse Generator n trigger input pin
TXn	CAN	CAN interface n TX output pin
Vcc	Supply	Power supply pin
Vss	Supply	Power supply pin
WOT	RTC	Real Time clock output pin
WOT_R	RTC	Relocated Real Time clock output pin
X0	Clock	Oscillator input pin
X0A	Clock	Subclock Oscillator input pin
X1	Clock	Oscillator output pin
X1A	Clock	Subclock Oscillator output pin
ZINn	QPRC	Quadrature Position/Revolution Counter Unit n input pin

5. Pin Circuit Type

Pin no.	I/O circuit type*	Pin name
1	Supply	Vss
2	F	C
3	M	P03_7 / INT1 / SIN1
4	H	P13_0 / INT2 / SOT1
5	M	P13_1 / INT3 / SCK1
6	H	P13_2 / PPG0 / TIN0 / FRCK1
7	H	P13_3 / PPG1 / TOT0 / WOT
8	M	P13_4 / SIN0 / INT6
9	H	P13_5 / SOT0 / ADTG / INT7
10	M	P13_6 / SCK0 / CKOTX0
11	H	P13_7 / PPG2 / CKOT0
12	N	P04_4 / PPG3 / SDA0
13	N	P04_5 / PPG4 / SCL0
14	I	P06_0 / AN0 / SCK5
15	K	P06_1 / AN1 / SOT5

64	C	MD
65	A	X0
66	A	X1
67	Supply	Vss
68	B	P04_0 / X0A
69	B	P04_1 / X1A
70	C	RSTX
71	H	P11_0
72	H	P11_1 / PPG0_R
73	H	P11_2 / PPG1_R
74	H	P11_3 / PPG2_R
75	H	P11_4 / PPG3_R
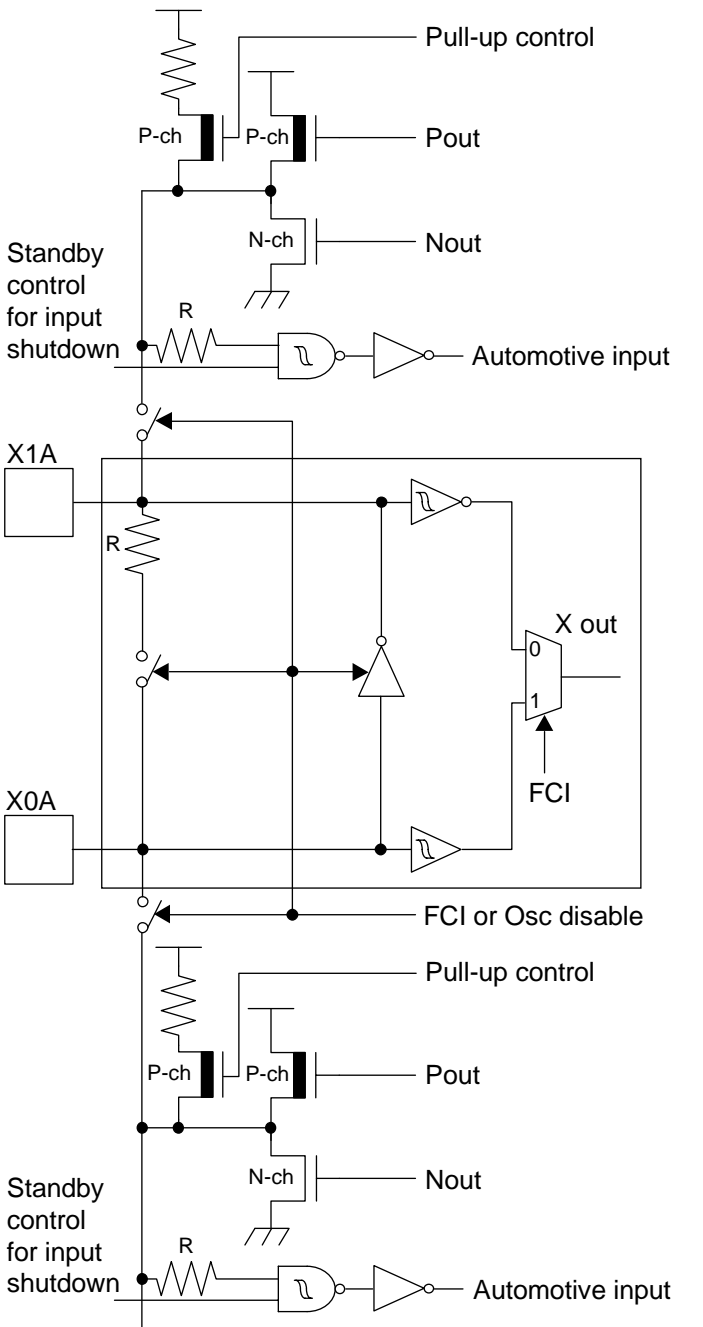

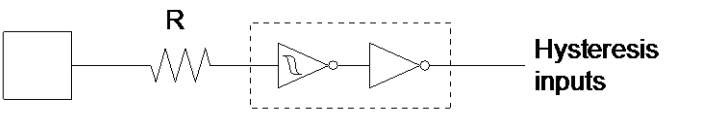

Pin no.	I/O circuit type*	Pin name
76	H	P11_5 / PPG4_R
77	H	P11_6 / FRCK0_R / ZIN1
78	H	P11_7 / IN0_R / AIN1
79	H	P12_0 / IN1_R / BIN1
80	H	P12_1 / TIN1_R / PPG0_B
81	H	P12_2 / TOT1_R / PPG1_B
82	H	P12_3 / OUT2_R
83	H	P12_4 / OUT3_R
84	H	P12_5 / TIN2_R / PPG2_B
85	H	P12_6 / TOT2_R / PPG3_B
86	H	P12_7 / INT1_R
87	H	P00_0 / INT3_R / FRCK2
88	H	P00_1 / INT4_R
89	H	P00_2 / INT5_R
90	Supply	Vcc
91	Supply	Vss
92	H	P00_3 / INT6_R / PPG8_B
93	H	P00_4 / INT7_R / PPG9_B
94	H	P00_5 / IN6 / TTG2 / TTG6 / PPG10_B
95	H	P00_6 / IN7 / TTG3 / TTG7 / PPG11_B
96	H	P00_7 / INT14
97	M	P01_0 / SCK7
98	H	P01_1 / CKOT1 / OUT0 / SOT7
99	M	P01_2 / CKOTX1 / OUT1 / INT15 / SIN7
100	H	P01_3 / PPG5
101	M	P01_4 / SIN4 / INT8
102	H	P01_5 / SOT4
103	M	P01_6 / SCK4 / TTG12
104	M	P01_7 / CKOTX1_R / INT9 / TTG13 / ZIN0 / SCK7_R
105	H	P02_0 / CKOT1_R / INT10 / TTG14 / AIN0 / SOT7_R
106	H	P02_1 / IN6_R / TTG15
107	M	P02_2 / IN7_R / CKOT0_R / INT12 / BIN0 / SIN7_R
108	H	P02_3 / PPG12_B
109	H	P02_4 / PPG13_B
110	M	P02_5 / OUT0_R / INT13 / SIN5_R
111	H	P02_6 / OUT1_R
112	H	P02_7 / PPG5_R
113	H	P03_0 / PPG4_B
114	H	P03_1 / PPG5_B
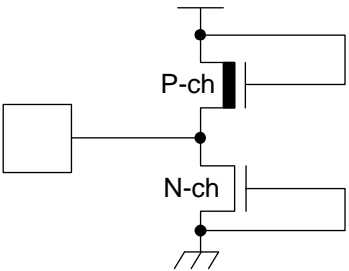

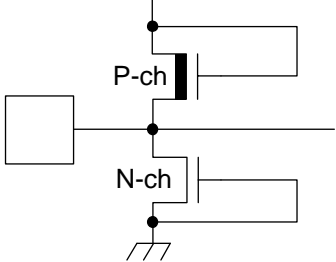

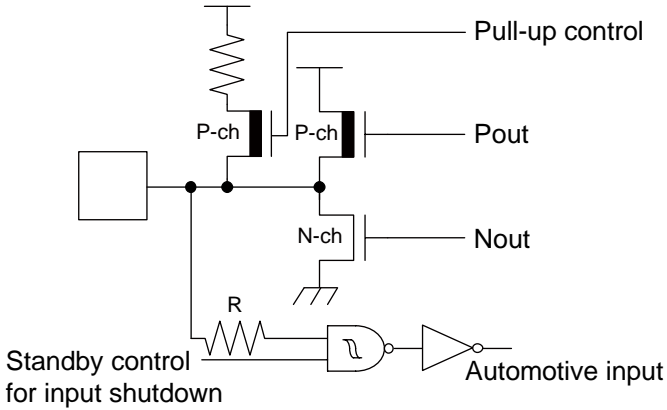

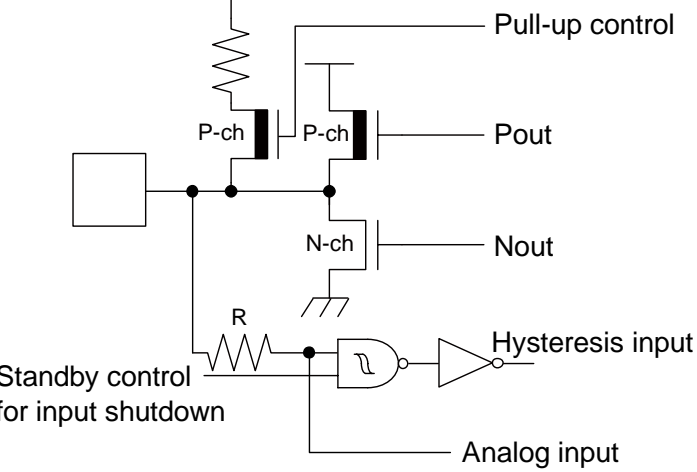

Pin no.	I/O circuit type*	Pin name
115	H	P03_2 / PPG14_B / SOT5_R
116	M	P03_3 / PPG15_B / SCK5_R
117	M	P03_4 / RX0 / INT4
118	H	P03_5 / TX0
119	H	P03_6 / INT0 / NMI
120	Supply	Vcc
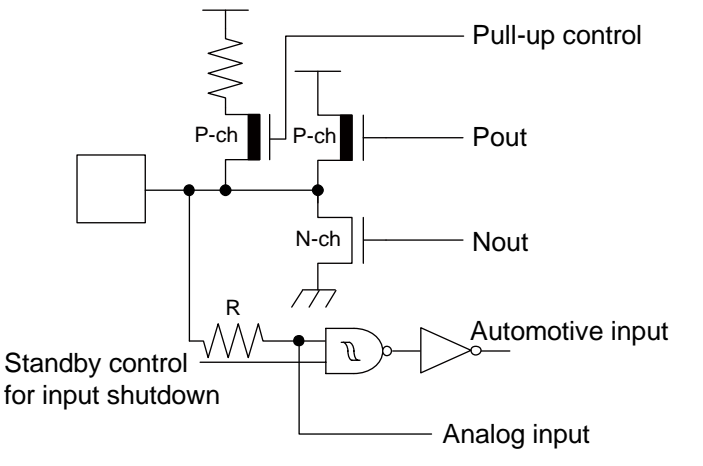

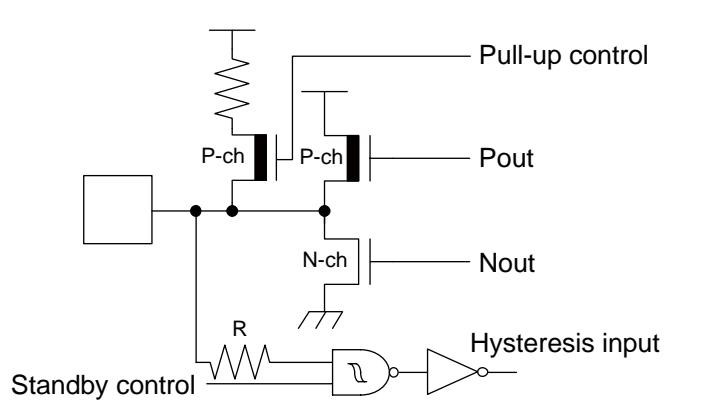

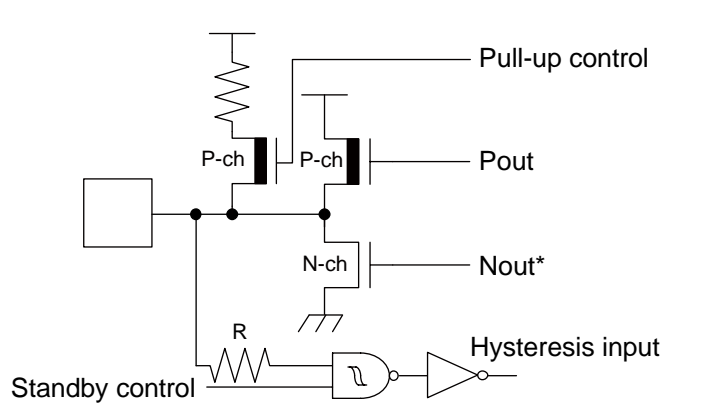

*: See " I/O circuit type" for details on the I/O circuit types.
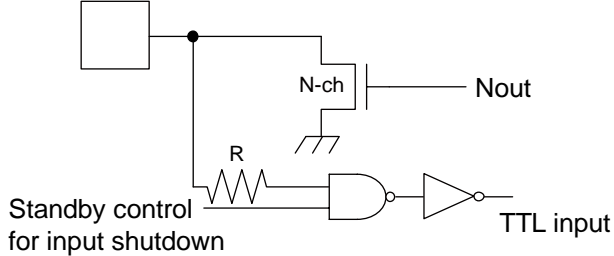

6. I/O Circuit Type

Type	Circuit	Remarks
A		High-speed oscillation circuit: ■ Programmable between oscillation mode (external crystal or resonator connected to X0/X1 pins) and Fast external Clock Input (FCI) mode (external clock connected to X0 pin) ■ Feedback resistor = approx. 1.0MΩ ■ The amplitude: 1.8V±0.15V to operate by the internal supply voltage

Type	Circuit	Remarks
B		Low-speed oscillation circuit shared with GPIO functionality: ■Feedback resistor = approx. 5.0MΩ ■GPIO functionality selectable (CMOS level output (I_{OL} = 4mA, I_{OH} = -4mA), Automotive input with input shutdown function and programmable pull-up resistor)
C		CMOS hysteresis input pin

Type	Circuit	Remarks
F		Power supply input protection circuit
G		■A/D converter ref+ (AVRH)/ ref- (AVRL) power supply input pin with protection circuit ■Without protection circuit against V_{CC} for pins AVRH/AVRL
H		■CMOS level output (I_{OL} = 4mA, I_{OH} = -4mA) ■Automotive input with input shutdown function ■Programmable pull-up resistor
I		■CMOS level output (I_{OL} = 4mA, I_{OH} = -4mA) ■CMOS hysteresis input with input shutdown function ■Programmable pull-up resistor ■Analog input

Type	Circuit	Remarks
K		■CMOS level output (I_{OL} = 4mA, I_{OH} = -4mA) ■Automotive input with input shutdown function ■Programmable pull-up resistor ■Analog input
M		■CMOS level output (I_{OL} = 4mA, I_{OH} = -4mA) ■CMOS hysteresis input with input shutdown function ■Programmable pull-up resistor
N		■CMOS level output (I_{OL} = 3mA, I_{OH} = -3mA) ■CMOS hysteresis input with input shutdown function ■Programmable pull-up resistor *: N-channel transistor has slew rate control according to I^2C spec, irrespective of usage.

Type	Circuit	Remarks
O		■Open-drain I/O ■Output 25mA, Vcc = 2.7V ■TTL input

12. Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Spansion semiconductor devices.

12.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

■Absolute Maximum Ratings
Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

■Recommended Operating Conditions
Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

■Processing and Protection of Pins
These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device, and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.
Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

■Latch-up
Semiconductor devices are constructed by the formation of P-type and N-type areas on a substrate. When subjected to abnormally high voltages, internal parasitic PNPN junctions (called thyristor structures) may be formed, causing large current levels in excess of several hundred mA to flow continuously at the power supply pin. This condition is called latch-up.

CAUTION: The occurrence of latch-up not only causes loss of reliability in the semiconductor device, but can cause injury or damage from high heat, smoke or flame. To prevent this from happening, do the following:

(1) Be sure that voltages applied to pins do not exceed the absolute maximum ratings. This should include attention to abnormal noise, surge levels, etc.

(2) Be sure that abnormal current flows do not occur during the power-on sequence.

■Observance of Safety Regulations and Standards
Most countries in the world have established standards and regulations regarding safety, protection from electromagnetic interference, etc. Customers are requested to observe applicable regulations and standards in the design of products.

■Fail-Safe Design
Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

■Precautions Related to Usage of Devices
Cypress semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION: Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

12.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Spansion's recommended conditions. For detailed information about mount conditions, contact your sales representative.

■Lead Insertion Type
Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Spansion recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

■Surface Mount Type
Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Spansion recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Spansion ranking of recommended conditions.

■Lead-Free Packaging
CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

■Storage of Semiconductor Devices
Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

  (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.

  (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5°C and 30°C.

   When you open Dry Package that recommends humidity 40% to 70% relative humidity.

  (3) When necessary, Spansion packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.

  (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

■Baking
Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Spansion recommended conditions for baking.

Condition: 125°C/24 h

■Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

(1) Maintain relative humidity in the working environment between 40% and 70%. Use of an apparatus for ion generation may be needed to remove electricity.

(2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.

(3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.

(4) Ground all fixtures and instruments, or protect with anti-static measures.

(5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

12.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

(1) Humidity

Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.

(2) Discharge of Static Electricity

When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.

(3) Corrosive Gases, Dust, or Oil

Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.

(4) Radiation, Including Cosmic Radiation

Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.

(5) Smoke, Flame

CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

13. Handling Devices

Special care is required for the following when handling the device:

- Latch-up prevention
- Unused pins handling
- External clock usage
- Notes on PLL clock mode operation
- Power supply pins (Vcc/Vss)
- Crystal oscillator and ceramic resonator circuit
- Turn on sequence of power supply to A/D converter and analog inputs
- Pin handling when not using the A/D converter
- Notes on Power-on
- Stabilization of power supply voltage
- Serial communication
- Mode Pin (MD)

1. Latch-up prevention
CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than V_{CC} or lower than V_{SS} is applied to an input or output pin.

- A voltage higher than the rated voltage is applied between Vcc pins and Vss pins.

- The AV_{CC} power supply is applied before the V_{CC} voltage.

Latch-up may increase the power supply current dramatically, causing thermal damages to the device.

For the same reason, extra care is required to not let the analog power-supply voltage (AV_{CC}, AVRH) exceed

the digital power-supply voltage.

2. Unused pins handling
Unused input pins can be left open when the input is disabled (corresponding bit of Port Input Enable register

PIER = 0).

Leaving unused input pins open when the input is enabled may result in misbehavior and possible permanent

damage of the device. To prevent latch-up, they must therefore be pulled up or pulled down through resistors which should be more than 2kΩ.

Unused bidirectional pins can be set either to the output state and be then left open, or to the input state with

either input disabled or external pull-up/pull-down resistor as described above.
3. External clock usage

The permitted frequency range of an external clock depends on the oscillator type and configuration.

See AC Characteristics for detailed modes and frequency limits. Single and opposite phase external clocks must be connected as follows:

(1) Single phase external clock for Main oscillator

When using a single phase external clock for the Main oscillator, X0 pin must be driven and X1 pin left open.
And supply 1.8V power to the external clock.

(2) Single phase external clock for Sub oscillator

When using a single phase external clock for the Sub oscillator, "External clock mode" must be selected and X0A/P04_0 pin must be driven. X1A/P04_1 pin can be configured as GPIO.

(3) Opposite phase external clock

When using an opposite phase external clock, X1 (X1A) pins must be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins. Supply level on X0 and X1 pins must be 1.8V.
4. Notes on PLL clock mode operation

If the microcontroller is operated with PLL clock mode and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

5. Power supply pins (Vcc/Vss)

It is required that all V_{CC}-level as well as all V_{SS}-level power supply pins are at the same potential. If there is more than one V_{CC} or V_{SS} level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

Vcc and Vss pins must be connected to the device from the power supply with lowest possible impedance.

The smoothing capacitor at Vcc pin must use the one of a capacity value that is larger than Cs.

Besides this, as a measure against power supply noise, it is required to connect a bypass capacitor of about $0.1\,\mu F$ between Vcc and Vss pins as close as possible to Vcc and Vss pins.

6. **Crystal oscillator and ceramic resonator circuit**

   Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

   It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

   It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

7. **Turn on sequence of power supply to A/D converter and analog inputs**

   It is required to turn the A/D converter power supply (AV_{CC}, AVRH, AVRL) and analog inputs (ANn) on after turning the digital power supply (V_{CC}) on.

   It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, AVRH must not exceed AV_{CC}. Input voltage for ports shared with analog input ports also must not exceed AV_{CC} (turning the analog and digital power supplies simultaneously on or off is acceptable).

8. **Pin handling when not using the A/D converter**

   If the A/D converter is not used, the power supply pins for A/D converter should be connected such as $AV_{CC} = V_{CC}$, $AV_{SS} =$ AVRH =AVRL = V_{SS}.

9. **Notes on Power-on**

   To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than 50μs from 0.2V to 2.7V.

10. **Stabilization of power supply voltage**

    If the power supply voltage varies acutely even within the operation safety range of the V_{CC} power supply voltage, a malfunction may occur. The V_{CC} power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that V_{CC} ripple fluctuations (peak to peak value) in the commercial frequencies (50Hz to 60Hz) fall within 10% of the standard V_{CC} power supply voltage and the transient fluctuation rate becomes 0.1V/μs or less in instantaneous fluctuation for power supply switching.

11. **Serial communication**

    There is a possibility to receive wrong data due to noise or other causes on the serial communication.

    Therefore, design a printed circuit board so as to avoid noise.

    Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

12. **Mode Pin (MD)**

    Connect the mode pin directly to Vcc or Vss pin. To prevent the device unintentionally entering test mode due to noise, lay out the printed circuit board so as to minimize the distance from the mode pin to Vcc or Vss pin and provide a low-impedance connection.

14. Electrical Characteristics

14.1 Absolute Maximum Ratings

Parameter	Symbol	Condition	Rating		Unit	Remarks
			Min	Max		
Power supply voltage[1]	V_{CC}	-	V_{SS} - 0.3	V_{SS} + 6.0	V	
Analog power supply voltage[1]	AV_{CC}	-	V_{SS} - 0.3	V_{SS} + 6.0	V	$V_{CC} = AV_{CC}$[2]
Analog reference voltage[1]	AVRH, AVRL	-	V_{SS} - 0.3	V_{SS} + 6.0	V	$AV_{CC} \geq$ AVRH, $AV_{CC} \geq$ AVRL, AVRH > AVRL, AVRL $\geq AV_{SS}$
Input voltage[1]	V_I	-	V_{SS} - 0.3	V_{SS} + 6.0	V	$V_I \leq V_{CC}$ + 0.3V[3]
Output voltage[1]	V_O	-	V_{SS} - 0.3	V_{SS} + 6.0	V	$V_O \leq V_{CC}$ + 0.3V[3]
Maximum Clamp Current	I_{CLAMP}	-	-4.0	+4.0	mA	Applicable to general purpose I/O pins [4]
Total Maximum Clamp Current	$\Sigma|I_{CLAMP}|$	-	-	33	mA	Applicable to general purpose I/O pins [4]
"L" level maximum output current	I_{OL}	-	-	15	mA	
"L" level average output current	I_{OLAV}	-	-	4	mA	
"L" level maximum overall output current	ΣI_{OL}	-	-	82	mA	
"L" level average overall output current	ΣI_{OLAV}	-	-	41	mA	
"H" level maximum output current	I_{OH}	-	-	-15	mA	
"H" level average output current	I_{OHAV}	-	-	-4	mA	
"H" level maximum overall output current	ΣI_{OH}	-	-	-82	mA	
"H" level average overall output current	ΣI_{OHAV}	-	-	-41	mA	
Power consumption[5]	P_D	T_A= +125°C	-	446[6]	mW	
Operating ambient temperature	T_A	-	-40	+125[7]	°C	
Storage temperature	T_{STG}	-	-55	+150	°C	

[1]: This parameter is based on $V_{SS} = AV_{SS} = 0V$.

[2]: AV_{CC} and V_{CC} must be set to the same voltage. It is required that AV_{CC} does not exceed V_{CC} and that the voltage at the analog inputs does not exceed AV_{CC} when the power is switched on.

[3]: V_I and V_O should not exceed V_{CC} + 0.3V. V_I should also not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating. Input/Output voltages of standard ports depend on V_{CC}.

[4]: • Applicable to all general purpose I/O pins (Pnn_m).
  • Use within recommended operating conditions.
  • Use at DC voltage (current).
  • The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
  • The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  • Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{CC} pin, and this may affect other devices.
  • Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0V), the power supply is provided from the pins, so that incomplete operation may result.
  • Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset.
  • The DEBUG I/F pin has only a protective diode against V_{SS}. Hence it is only permitted to input a negative clamping current (4mA). For protection against positive input voltages, use an external clamping diode which limits the input voltage to maximum 6.0V.

• Sample recommended circuits:
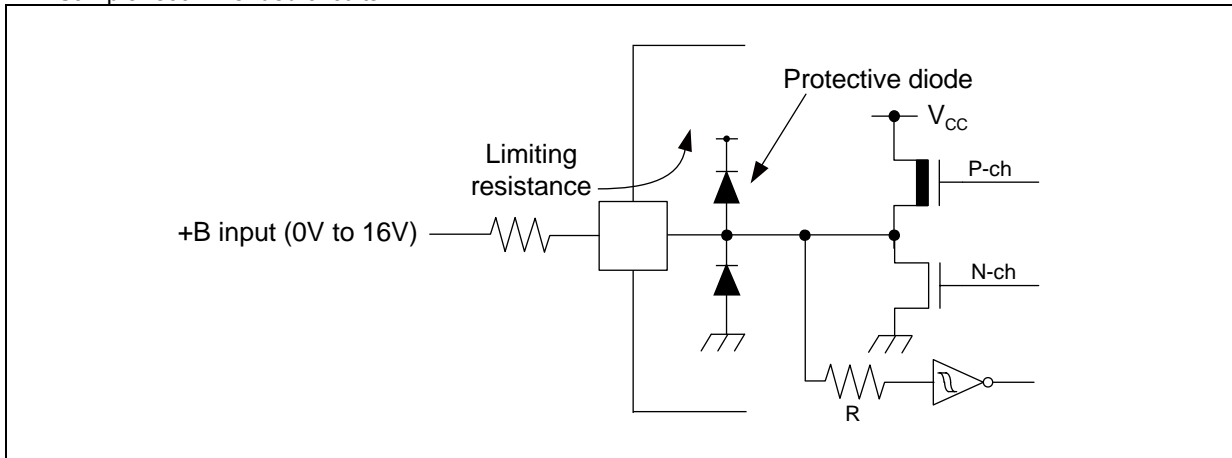

*5: The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.

The actual power dissipation depends on the customer application and can be calculated as follows:

$P_D = P_{IO} + P_{INT}$

$P_{IO} = \Sigma (V_{OL} \times I_{OL} + V_{OH} \times I_{OH})$ (I/O load power dissipation, sum is performed on all I/O ports)

$P_{INT} = V_{CC} \times (I_{CC} + I_A)$ (internal power dissipation)

I_{CC} is the total core current consumption into V_{CC} as described in the "DC characteristics" and depends on the selected operation mode and clock frequency and the usage of functions like Flash programming.

I_A is the analog current consumption into AV_{CC}.

*6: Worst case value for a package mounted on single layer PCB at specified T_A without air flow.

*7: Write/erase to a large sector in flash memory is warranted with $T_A \leq + 105°C$.

WARNING

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

14.2 Recommended Operating Conditions

$(V_{SS} = AV_{SS} = 0V)$

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	V_{CC}, AV_{CC}	2.7	-	5.5	V	
		2.0	-	5.5	V	Maintains RAM data in stop mode
Smoothing capacitor at C pin	C_S	0.5	1.0 to 3.9	4.7	μF	1.0μF (Allowance within ± 50%) 3.9µF (Allowance within ± 20%) Please use the ceramic capacitor or the capacitor of the frequency response of this level. The smoothing capacitor at V_{CC} must use the one of a capacity value that is larger than C_S.

WARNING

The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

14.3 DC Characteristics

14.3.1 Current Rating

*1: The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock connected to the Sub oscillator. See chapter "Standby mode and voltage regulator control circuit" of the Hardware Manual for further details about voltage regulator control. Current for "On Chip Debugger" part is not included. Power supply current in Run mode does not include Flash Write / Erase current.

*2: The power supply current in Timer mode is the value when Flash is in Power-down / reset mode.

When Flash is not in Power-down / reset mode, $I_{CCFLASHPD}$ must be added to the Power supply current.

The power supply current is measured with a 4MHz external clock connected to the Main oscillator and a 32kHz external clock connected to the Sub oscillator. The current for "On Chip Debugger" part is not included.

*3: The power supply current in Stop mode is the value when Flash is in Power-down / reset mode.

When Flash is not in Power-down / reset mode, $I_{CCFLASHPD}$ must be added to the Power supply current.

*4: When low voltage detector is enabled, I_{CCLVD} must be added to Power supply current.

*5: When Flash Write / Erase program is executed, $I_{CCFLASH}$ must be added to Power supply current.

14.3.2 Pin Characteristics

(V_{CC} = AV_{CC} = 2.7V to 5.5V, V_{SS} = AV_{SS} = 0V, T_A = - 40°C to + 125°C)

14.4 AC Characteristics

14.4.1 Main Clock Input Characteristics

($V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, VD=$1.8V\pm0.15V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C$)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Input frequency	f_C	X0, X1	4	-	8	MHz	When using a crystal oscillator, PLL off
			-	-	8	MHz	When using an opposite phase external clock, PLL off
			4	-	8	MHz	When using a crystal oscillator or opposite phase external clock, PLL on
Input frequency	f_{FCI}	X0	-	-	8	MHz	When using a single phase external clock in "Fast Clock Input mode", PLL off
			4	-	8	MHz	When using a single phase external clock in "Fast Clock Input mode", PLL on
Input clock cycle	t_{CYLH}	-	125	-	-	ns	
Input clock pulse width	P_{WH}, P_{WL}	-	55	-	-	ns	

When using the crystal oscillator

t_{CYLH}

X0,X1

Reference value: 1.8V±0.15V

The amplitude changes by resistance, capacity which added outside or the difference of the device.

When using the external clock
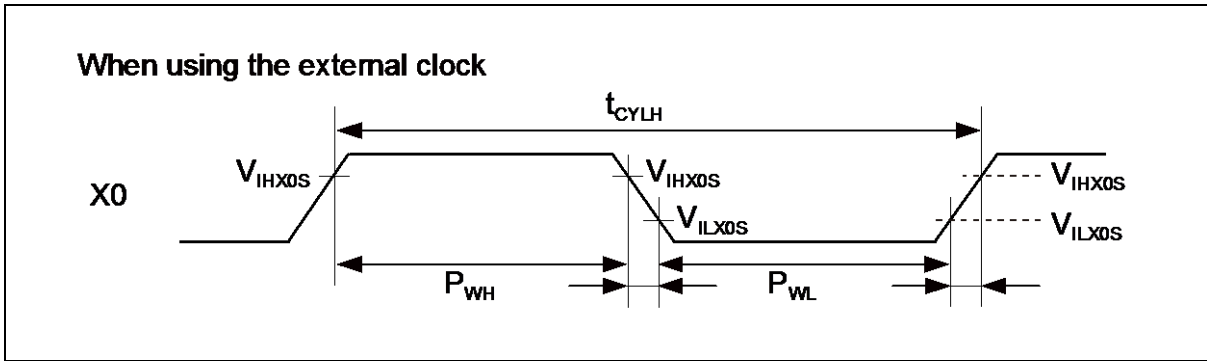

14.4.2 Sub Clock Input Characteristics

$(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = - 40°C \text{ to } + 125°C)$

Parameter	Symbol	Pin name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Input frequency	f_{CL}	X0A, X1A	-	-	32.768	-	kHz	When using an oscillation circuit
			-	-	-	100	kHz	When using an opposite phase external clock
		X0A	-	-	-	50	kHz	When using a single phase external clock
Input clock cycle	t_{CYLL}	-	-	10	-	-	μs	
Input clock pulse width	-	-	P_{WH}/t_{CYLL}, P_{WL}/t_{CYLL}	30	-	70	%	
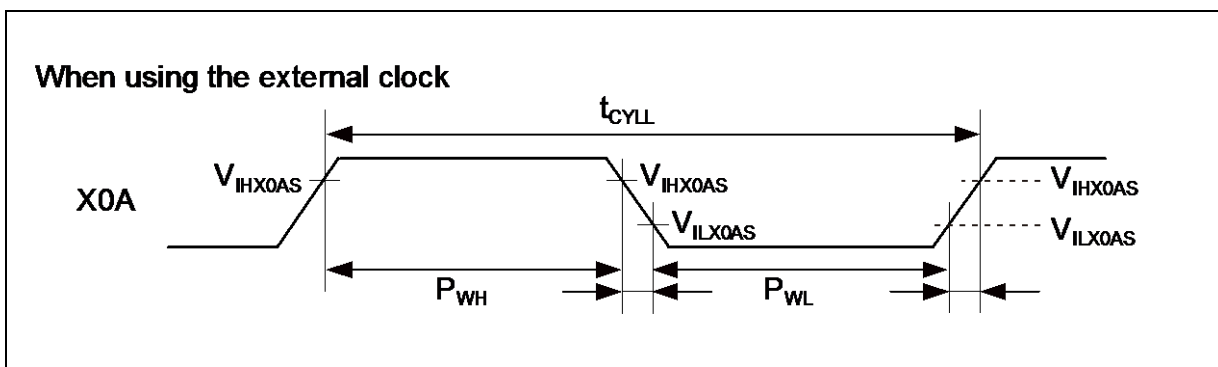

14.4.3 Built-in RC Oscillation Characteristics

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Clock frequency	f_{RC}	50	100	200	kHz	When using slow frequency of RC oscillator
		1	2	4	MHz	When using fast frequency of RC oscillator
RC clock stabilization time	t_{RCSTAB}	80	160	320	μs	When using slow frequency of RC oscillator (16 RC clock cycles)
		64	128	256	μs	When using fast frequency of RC oscillator (256 RC clock cycles)

14.4.4 Internal Clock Timing

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Value		Unit
		Min	Max	
Internal System clock frequency (CLKS1 and CLKS2)	f_{CLKS1}, f_{CLKS2}	-	54	MHz
Internal CPU clock frequency (CLKB), Internal peripheral clock frequency (CLKP1)	f_{CLKB}, f_{CLKP1}	-	32	MHz
Internal peripheral clock frequency (CLKP2)	f_{CLKP2}	-	32	MHz

14.4.5 Operating Conditions of PLL

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
PLL oscillation stabilization wait time	t_{LOCK}	1	-	4	ms	For CLKMC = 4MHz
PLL input clock frequency	f_{PLLI}	4	-	8	MHz	
PLL oscillation clock frequency	f_{CLKVCO}	56	-	108	MHz	Permitted VCO output frequency of PLL (CLKVCO)
PLL phase jitter	t_{PSKEW}	-5	-	+5	ns	For CLKMC (PLL input clock) ≥ 4MHz
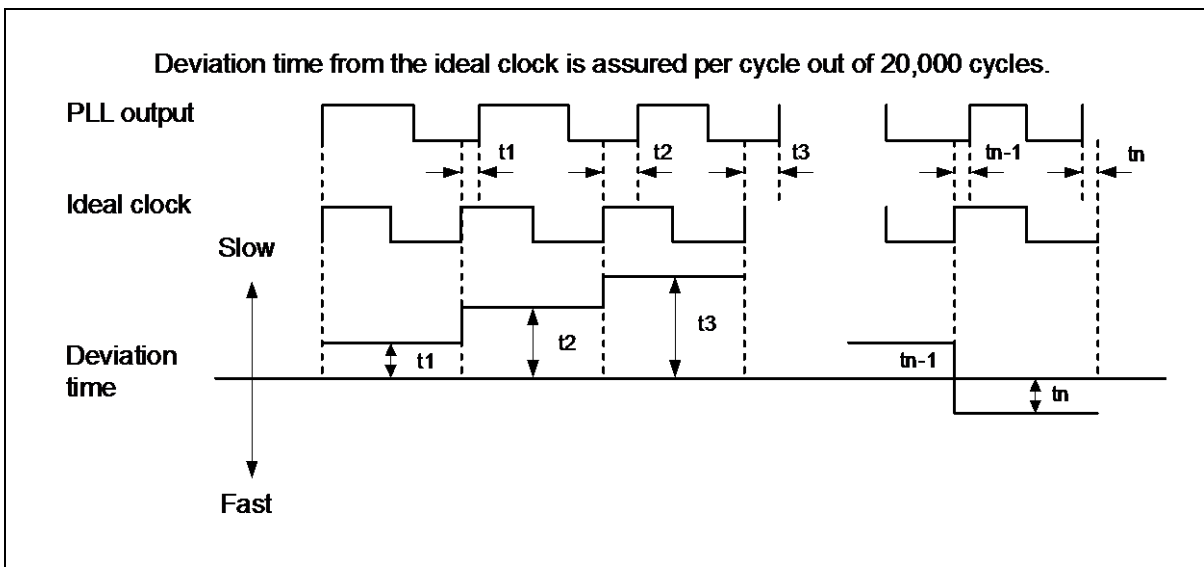

14.4.6 Reset Input

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Pin name	Value		Unit
			Min	Max	
Reset input time	t_{RSTL}	RSTX	10	-	μs
Rejection of reset input time			1	-	μs
14.4.7 Power-on Reset Timing

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Pin name	Value			Unit
			Min	Typ	Max	
Power on rise time	t_R	Vcc	0.05	-	30	ms
Power off time	t_{OFF}	Vcc	1	-	-	ms

If the power supply is changed too rapidly, a power-on reset may occur. We recommend a smooth startup by restraining voltages when changing the power supply voltage during operation, as shown in the figure below.

It is required that rises in voltage have a slope of 50 mV/ms or less.
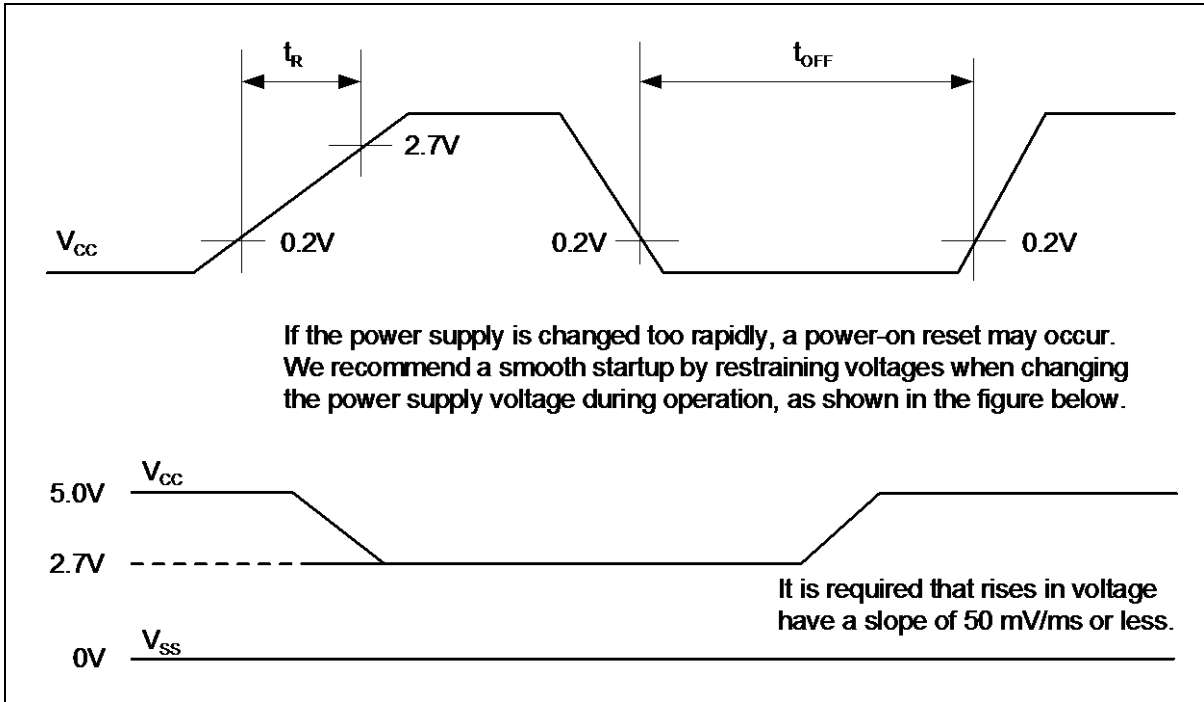

14.4.8 USART Timing

(V_{CC} = AV_{CC} = 2.7V to 5.5V, V_{SS} = AV_{SS} = 0V, T_A = - 40°C to + 125°C, C_L=50pF)

Parameter	Symbol	Pin name	Conditions	4.5V ≤ V_{CC} < 5.5V		2.7V ≤ V_{CC} < 4.5V		Unit
				Min	Max	Min	Max	
Serial clock cycle time	t_{SCYC}	SCKn		$4t_{CLKP1}$	-	$4t_{CLKP1}$	-	ns
SCK ↓ → SOT delay time	t_{SLOVI}	SCKn, SOTn		- 20	+ 20	- 30	+ 30	ns
SOT → SCK ↑ delay time	t_{OVSHI}	SCKn, SOTn	Internal shift clock mode	$N \times t_{CLKP1}$ − 20*	-	$N \times t_{CLKP1}$ − 30*	-	ns
SIN → SCK ↑ setup time	t_{IVSHI}	SCKn, SINn		t_{CLKP1} + 45	-	t_{CLKP1} + 55	-	ns
SCK ↑ → SIN hold time	t_{SHIXI}	SCKn, SINn		0	-	0	-	ns
Serial clock "L" pulse width	t_{SLSH}	SCKn		t_{CLKP1} + 10	-	t_{CLKP1} + 10	-	ns
Serial clock "H" pulse width	t_{SHSL}	SCKn		t_{CLKP1} + 10	-	t_{CLKP1} + 10	-	ns
SCK ↓ → SOT delay time	t_{SLOVE}	SCKn, SOTn	External shift clock mode	-	$2t_{CLKP1}$ + 45	-	$2t_{CLKP1}$ + 55	ns
SIN → SCK ↑ setup time	t_{IVSHE}	SCKn, SINn		t_{CLKP1}/2 + 10	-	t_{CLKP1}/2 + 10	-	ns
SCK ↑ → SIN hold time	t_{SHIXE}	SCKn, SINn		t_{CLKP1} + 10	-	t_{CLKP1} + 10	-	ns
SCK fall time	t_F	SCKn		-	20	-	20	ns
SCK rise time	t_R	SCKn		-	20	-	20	ns

Notes:
- AC characteristic in CLK synchronized mode.
- C_L is the load capacity value of pins when testing.
- Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters. These parameters are shown in "MB96600 series HARDWARE MANUAL".
- t_{CLKP1} indicates the peripheral clock 1 (CLKP1), Unit: ns
- These characteristics only guarantee the same relocate port number.
  For example, the combination of SCKn and SOTn_R is not guaranteed.

*: Parameter N depends on t_{SCYC} and can be calculated as follows:

- If t_{SCYC} = $2 \times k \times t_{CLKP1}$, then N = k, where k is an integer > 2

- If t_{SCYC} = $(2 \times k + 1) \times t_{CLKP1}$, then N = k + 1, where k is an integer > 1

Examples:

t_{SCYC}	N
$4 \times t_{CLKP1}$	2
$5 \times t_{CLKP1}$, $6 \times t_{CLKP1}$	3
$7 \times t_{CLKP1}$, $8 \times t_{CLKP1}$	4
...	...

Internal shift clock mode

External shift clock mode

●
14.4.9 External Input Timing

(V$_{CC}$ = AV$_{CC}$ = 2.7V to 5.5V, V$_{SS}$ = AV$_{SS}$ = 0V, T$_A$ = - 40°C to + 125°C)

Parameter	Symbol	Pin name	Value		Unit	Remarks
			Min	Max		
Input pulse width	t$_{INH}$, t$_{INL}$	Pnn_m	2t$_{CLKP1}$ +200 (t$_{CLKP1}$= 1/f$_{CLKP1}$)*	-	ns	General Purpose I/O
		ADTG				A/D Converter trigger input
		TINn, TINn_R				Reload Timer
		TTGn				PPG trigger input
		FRCKn, FRCKn_R				Free-Running Timer input clock
		INn, INn_R				Input Capture
		AINn, BINn, ZINn				Quadrature Position/Revolution Counter
		INTn, INTn_R	200	-	ns	External Interrupt
		NMI				Non-Maskable Interrupt

*: t$_{CLKP1}$ indicates the peripheral clock1 (CLKP1) cycle time except stop when in stop mode.
14.4.10 I^2C Timing

$(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = -40°C \text{ to } +125°C)$

STOP condition setup time SCL↑→SDA↑	t_{SUSTO}		4.0	-	0.6	-	µs
Bus free time between "STOP condition" and "START condition"	t_{BUS}		4.7	-	1.3	-	µs
Pulse width of spikes which will be suppressed by input noise filter	t_{SP}	-	0	$(1-1.5) \times t_{CLKP1}$*[5]	0	$(1-1.5) \times t_{CLKP1}$*[5]	ns

*1: R and C_L represent the pull-up resistance and load capacitance of the SCL and SDA lines, respectively. Vp indicates the power supply voltage of the pull-up resistance and I_{OL} indicates V_{OL} guaranteed current.

*2: The maximum t_{HDDAT} only has to be met if the device does not extend the "L" width (t_{LOW}) of the SCL signal.

*3: A high-speed mode I^2C bus device can be used on a standard mode I^2C bus system as long as the device satisfies the requirement of "$t_{SUDAT} \geq 250ns$".

*4: For use at over 100kHz, set the peripheral clock1 (CLKP1) to at least 6MHz.

*5: t_{CLKP1} indicates the peripheral clock1 (CLKP1) cycle time.
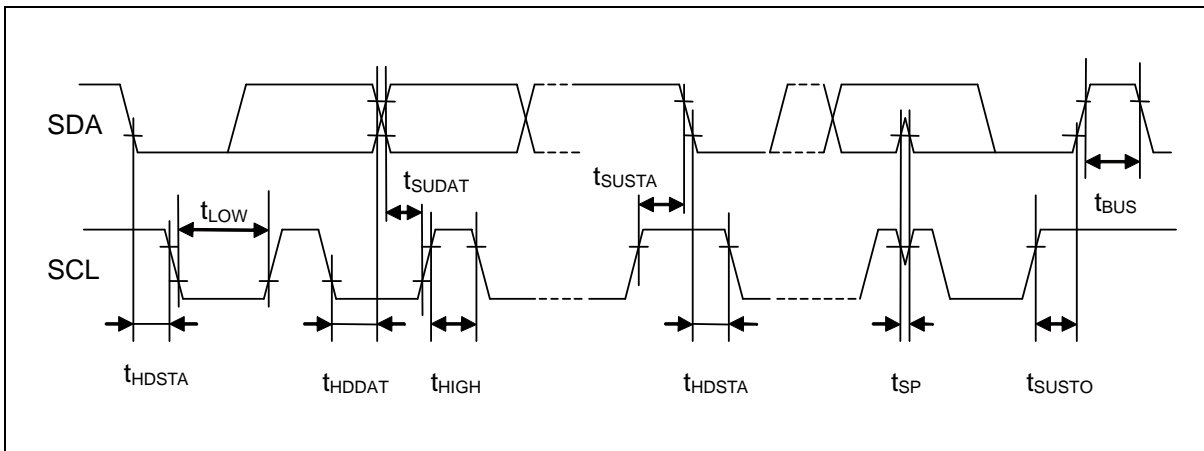

14.5 A/D Converter

14.5.1 Electrical Characteristics for the A/D Converter

$(V_{CC} = AV_{CC} = 2.7V$ to $5.5V$, $V_{SS} = AV_{SS} = 0V$, $T_A = -40°C$ to $+125°C)$

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max

Variation between channels	-	ANn	-	-	4.0	LSB	

*: Time for each channel.

14.5.2 Accuracy and Setting of the A/D Converter Sampling Time

If the external impedance is too high or the sampling time too short, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting the A/D conversion precision.

To satisfy the A/D conversion precision, a sufficient sampling time must be selected. The required sampling time (Tsamp) depends on the external driving impedance R_{ext}, the board capacitance of the A/D converter input pin C_{ext} and the AV_{CC} voltage level. The following replacement model can be used for the calculation:
R_{ext}: External driving impedance

C_{ext}: Capacitance of PCB at A/D converter input

C_{VIN}: Analog input capacity (I/O, analog switch and ADC are contained)

R_{VIN}: Analog input impedance (I/O, analog switch and ADC are contained)

The following approximation formula for the replacement model above can be used:

$$Tsamp = 7.62 \times (Rext \times Cext + (Rext + R_{VIN}) \times C_{VIN})$$

■Do not select a sampling time below the absolute minimum permitted value.
(0.5µs for 4.5V ≤ AV_{CC} ≤ 5.5V, 1.2µs for 2.7V ≤ AV_{CC} < 4.5V)

■If the sampling time cannot be sufficient, connect a capacitor of about 0.1µF to the analog input pin.

■A big external driving impedance also adversely affects the A/D conversion precision due to the pin input leakage current IIL (static current before the sampling switch) or the analog input leakage current IAIN (total leakage current of pin input and comparator during sampling). The effect of the pin input leakage current IIL cannot be compensated by an external capacitor.

■The accuracy gets worse as |AVRH - AVRL| becomes smaller.

14.5.3 Definition of A/D Converter Terms

Resolution : Analog variation that is recognized by an A/D converter.

Nonlinearity error : Deviation of the actual conversion characteristics from a straight line that connects the zero transition point (0b0000000000 ←→ 0b0000000001) to the full-scale transition point (0b1111111110 ←→ 0b1111111111).

Differential nonlinearity error : Deviation from the ideal value of the input voltage that is required to change the output code by 1LSB.

Total error : Difference between the actual value and the theoretical value. The total error includes zero transition error, full-scale transition error and nonlinearity error.

Zero transition voltage: Input voltage which results in the minimum conversion value.

Full scale transition voltage: Input voltage which results in the maximum conversion value.

$$\text{Nonlinearity error of digital output N} = \frac{V_{NT} - \{1LSB \times (N - 1) + V_{OT}\}}{1LSB} \; [LSB]$$

$$\text{Differential nonlinearity error of digital output N} = \frac{V_{(N+1)\,T} - V_{NT}}{1LSB} - 1 \; [LSB]$$

$$1LSB = \frac{V_{FST} - V_{OT}}{1022}$$

N : A/D converter digital output value.

V_{OT} : Voltage at which the digital output changes from 0x000 to 0x001.

V_{FST} : Voltage at which the digital output changes from 0x3FE to 0x3FF.

V_{NT} : Voltage at which the digital output changes from 0x(N − 1) to 0xN.

$$1\text{LSB (Ideal value)} = \frac{AVRH - AVRL}{1024}\ [V]$$

$$\text{Total error of digital output N} = \frac{V_{NT} - \{1LSB \times (N - 1) + 0.5LSB\}}{1LSB}$$

N   : A/D converter digital output value.
V_{NT} : Voltage at which the digital output changes from 0x(N + 1) to 0xN.
V_{OT} (Ideal value) = AVRL + 0.5LSB[V]
V_{FST} (Ideal value) = AVRH - 1.5LSB[V]

14.6 Low Voltage Detection Function Characteristics

$(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = -40°C \text{ to } +125°C)$

Parameter	Symbol	Conditions	Value			Unit
			Min	Typ	Max	
Detected voltage[1]	V_{DL0}	CILCR:LVL = 0000_B	2.70	2.90	3.10	V
	V_{DL1}	CILCR:LVL = 0001_B	2.79	3.00	3.21	V
	V_{DL2}	CILCR:LVL = 0010_B	2.98	3.20	3.42	V
	V_{DL3}	CILCR:LVL = 0011_B	3.26	3.50	3.74	V
	V_{DL4}	CILCR:LVL = 0100_B	3.45	3.70	3.95	V
	V_{DL5}	CILCR:LVL = 0111_B	3.73	4.00	4.27	V
	V_{DL6}	CILCR:LVL = 1001_B	3.91	4.20	4.49	V
Power supply voltage change rate[2]	dV/dt	-	- 0.004	-	+ 0.004	V/μs
Hysteresis width	V_{HYS}	CILCR:LVHYS=0	-	-	50	mV
		CILCR:LVHYS=1	80	100	120	mV
Stabilization time	$T_{LVDSTAB}$	-	-	-	75	μs
Detection delay time	t_d	-	-	-	30	μs

*1: If the power supply voltage fluctuates within the time less than the detection delay time (t_d), there is a possibility that the low voltage detection will occur or stop after the power supply voltage passes the detection range.

*2: In order to perform the low voltage detection at the detection voltage (V_{DLX}), be sure to suppress fluctuation of the power supply voltage within the limits of the change ration of power supply voltage.

14.7 Flash Memory Write/Erase Characteristics

$(V_{CC} = AV_{CC} = 2.7V \text{ to } 5.5V, V_{SS} = AV_{SS} = 0V, T_A = -40°C \text{ to } +125°C)$

Parameter		Conditions	Value			Unit	Remarks
			Min	Typ	Max		
Sector erase time	Large Sector	$T_A ≤ +105°C$	-	1.6	7.5	s	Includes write time prior to internal erase.
	Small Sector	-	-	0.4	2.1	s	
	Security Sector	-	-	0.31	1.65	s	
Word (16-bit) write time	Large Sector	$T_A ≤ +105°C$	-	25	400	μs	Not including system-level overhead time.
	Small Sector	-	-	25	400	μs	
Chip erase time		$T_A ≤ +105°C$	-	11.51	55.05	s	Includes write time prior to internal erase.

Note: While the Flash memory is written or erased, shutdown of the external power (V_{CC}) is prohibited. In the application system where the external power (V_{CC}) might be shut down while writing or erasing, be sure to turn the power off by using a low voltage detection function.
To put it concrete, change the external power in the range of change ration of power supply voltage (-0.004V/μs to +0.004V/μs) after the external power falls below the detection voltage (V_{DLX})[1].

Write/Erase cycles and data hold time

Write/Erase cycles (cycle)	Data hold time (year)
1,000	20 [2]
10,000	10 [2]
100,000	5 [2]

[1]: See "6. Low Voltage Detection Function Characteristics".

[2]: This value comes from the technology qualification (using Arrhenius equation to translate high temperature measurements into normalized value at +85°C).

15. Example Characteristics

This characteristic is an actual value of the arbitrary sample. It is not the guaranteed value.
