

# PAH8011ES: Low Power Heart Rate Monitor Optical Chip

## General Description

The PAH8011ES is a low power and high-performance CMOS-process optical chip with integrated DSP, targeted as a Heart Rate Detection (HRD) chip. It is based on optical sensing technology that captures higher resolution image than the traditional photodiode. The PAH8011ES could support three external discrete LEDs, which are two Green and one Infrared as illumination light source. The images captured are then processed through the integrated DSP to attain processed PPG (Photoplethysmogram) data for use in deducing heart rate.

## Key Features

- Support HRD, HRV (Heart Rate Variability), exercise functions
- 1596 bytes SRAM buffer
- Integrated ultra-low power mode, while in power-down mode
- Hardware power-down
- Invisible light for touch detection function
- Optical coating for anti-ambient light interference
- Three LED-drivers support
- Communication interface: I<sup>2</sup>C interface up to 1 Mbit/s

## Applications

- Heart Rate Monitor Accessories
- Wearables: Smartwatch, Wrist Band

### \*Disclaimer:

The PAH8011ES-IN is not designed for usage in medical device. In addition, the data and information of heart rate measurement provided by this chip may not be completely accurate and may exceed heart rate tolerance as per the specification stated in the document due to different factors, such as interference with signal from external sources, incorrect wearing position and changes in weather conditions or user's body condition.

**PIXART IMAGING INC. DISCLAIMS ALL LIABILITY ARISING FROM SUCH INACCURACY AND ASSUMES NO RESPONSIBILITY FOR THE CONSEQUENCES OF USE OF SUCH DATA AND INFORMATION.**

## Key Parameters

Parameter	Value
Operating Temperature, T <sub>j</sub>	-35 to +80 °C
System Clock	4 MHz
Supply Voltage	VDDM: 3.1 – 3.6 V* VDDLED: 3.3 – 4.5 V* VDDIO: 1.62 – 3.6 V VDDA/VDDD: 1.7 – 1.9 V Analog: 1.8 V Digital: 1.8 V
Power Consumption @ 3.3V <b>Note:</b> Including LED current, without I/O toggling	Active: With two LEDs: 340 μA With IR Touch Detection: 15 μA Power-down: 1 μA
Heart Rate Measurement Range	30 - 240 bpm
Package Size	4.0 x 4.0 x 1.0 mm

\*Refer to Section 8.16 Supply Voltage Registers

## Ordering Information

Part Number	Package Type
PAH8011ES-IN	16-Pin LGA

## 1.0 Introduction

### 1.1 Overview

The PAH8011ES is a discrete optical-based Heart Rate Detection (HRD) chip that optimizes for low power and high-performance operation. It has three LEDs driver to support with 2 Green LEDs and 1 Infrared LED externally. It comes with I<sup>2</sup>C communication interface, which supports up to 1 Mbit/s. SRAM buffer of 1596 bytes is supported for the power saving at the host.

The Figure 1 shows the architecture block diagram of the device. Refer to the subsequent chapters for detailed information on the functionality of the different interface blocks.

**Note:** Throughout this document PAH8011ES Low Power Optical Heart Rate Monitor Chip is referred to as the PAH8011ES.

Figure 1. Functional Block Diagram

### 1.2 Terminology

Term	Description
GND	Ground
BiDir	Bi-Directional
PPG	Photoplethysmogram
Touch	Touch detection for wear on or wear off

### 1.3 Signal Description

Figure 2. Pin Configuration

Table 1. Signal Pins Description

Pin No.	Signal Name	Type	Description
<b>Functional Group:</b>		<b>Power Supplies</b>	
1	VDDA	Input	Analog power supply (1.7 - 1.9V). Must connect 0.1μF capacitor to GND
2	VDDM	Input	Analog main power supply (3.1 - 3.6V) for internal power regulator
6	VSSLED	GND	LED Ground
7	VDDAY	Output	Internal regulator output. Must connect 0.1μF capacitor to GND
8	VSSA	GND	Analog Ground
14	VDDIO	Input	I/O Power Supply (1.62 - 3.6V)
15	VSSD	GND	Digital Ground
16	VDDD	Input	Digital power supply (1.7 - 1.9V). Must connect 0.1μF capacitor to GND
<b>Functional Group:</b>		<b>Interface</b>	
9	I2C_SCL	Input	I <sup>2</sup> C: Clock
10	I2C_SDA	BiDir	I <sup>2</sup> C: Data input-output
<b>Functional Group:</b>		<b>Functional I/O</b>	
11	POWERDN	Input	Hardware control to enter Power Down Mode. Connect to GND when not used Level High: Enter Power Down Mode Level Low: Leave Power Down Mode
12	INT2	Output	Touch interrupt. Default is edge sensitive interrupt, can be changed to level sensitive interrupt (high active) in INT_Type register
13	INT1	Output	Data ready interrupt. Default is edge sensitive interrupt, can be changed to level sensitive interrupt (high active) in INT_Type register
<b>Functional Group:</b>		<b>LED driver control</b>	
3	LED2	Output	LED2 driver connection. Must connect to Green LED cathode
4	LED1	Output	LED1 driver connection. Must connect to Green LED cathode
5	LED0	Output	LED0 driver connection. Must connect to IR LED cathode

## 2.0 Operating Specifications

### 2.1 Absolute Maximum Ratings

Table 2. Absolute Maximum Ratings

Parameters	Symbol	Min.	Max.	Unit	Notes
Analog Voltage	$V_{DDM\_MAX}$	-0.4	$V_{DDM} + 0.3$	V	
I/O Voltage	$V_{DDIO\_MAX}$	-0.4	$V_{DDIO} + 0.3$	V	
I/O Pin Input High Voltage	$V_{DDIO\_IN}$	-0.4	$V_{DDIO} + 0.3$	V	All I/O pins
Relative Humidity	RH	0	50	%	Non-condensing, Non-biased
ESD	$ESD_{HBM}$	-	2	kV	Class 2 on all pins, as per human body model. JESD22-A114E with 15 sec zap interval.

#### Notes:

1. At room temperature.
2. Maximum Ratings are those values beyond which damage to the device may occur.
3. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability.
4. Functional operation under absolute maximum-rated conditions is not implied and should be restricted to the Recommended Operating Conditions.

### 2.2 Recommended Operating Conditions

Table 3. Recommended Operating Conditions

Description	Symbol	Min.	Typ.	Max.	Unit	Notes
Ambient Temperature	$T_A$	-20	25	60	°C	
Operating Junction Temperature	$T_J$	-35	-	80	°C	
Power Supply Voltage	$V_{DDM}$	3.1	3.3	3.6	V	Power regulator input supply. Includes ripples
LED Power Supply Voltage	$V_{DDLED}$	3.3	-	4.5	V	LED power supply. Includes ripples
Analog Supply Voltage	$V_{DDA}$	1.7	1.8	1.9	V	Analog power supply. Includes ripples
Digital Supply Voltage	$V_{DDD}$	1.7	1.8	1.9	V	Digital power supply. Includes ripples
I/O Supply Voltage	$V_{DDIO}$	1.62	1.8	3.6	V	Includes ripples
Power Regulator Output Voltage	$V_{DDAY}$	2.52	2.8	3.08	V	Internal regulator output. Includes ripples
Supply Noise	$V_{Npp}$	-	-	100	mV <sub>p-p</sub>	Peak to peak within 10K – 80 MHz
I <sup>2</sup> C Clock Frequency	$SCL_{I^2C}$	-	400 <sup>1</sup>	1000 <sup>2</sup>	KHz	1. Max value for Fast mode 2. Max value for Fast mode plus

**Note:** PixArt does not guarantee the performance if the operating temperature is beyond the specified limit.

### 2.3 Thermal Specifications

Table 4. Thermal Specifications

Parameters	Symbol	Min.	Typ.	Max.	Unit	Notes
Storage Temperature	$T_S$	-40	-	125	°C	
Lead-free Solder Temperature	$T_P$	-	-	245	°C	Refer to Package Handling Information document

### 2.4 DC Characteristics

Table 5. DC Electrical Specifications

Parameters	Symbol	Min.	Typ.	Max.	Unit	Conditions
Peak Power Supply Current	$I_{DDM\_MAX}$	-	-	10	mA	For $V_{DDM}$
	$I_{DDLED\_MAX}$	-	-	150	mA	For $V_{DDLED}$
	$I_{DDD\_MAX}$	-	-	20	mA	For $V_{DDD}$
	$I_{DDA\_MAX}$	-	-	10	mA	For $V_{DDA}$
Peak I/O Supply Current	$I_{DDIO\_MAX}$	-	-	30	mA	For $V_{DDIO}$
Output Supply Current	$I_{DDAY\_MAX}$	-	-	20	mA	For $V_{DDAY}$

#### Power Consumption

Supply Current @ Power Down	$I_{DDPD}$	-	1	-	µA	For chip only Wakeup by read register
-----------------------------	------------	---	---	---	----	--

#### With Two Green LEDs

Supply Current @ HRD PPG mode	$I_{DDHRD}$	-	100	-	µA	For chip only, not including LED current, without I <sup>2</sup> C interface I/O toggle
LED current	$I_{DDLED}$	-	240	-	µA	20 report/sec, LED DAC = 50mA, on yellow skin color (ET=30us)

#### With IR Touch Detection

Supply Current @ Touch Detection mode	$I_{DDtouch}$	-	9	-	µA	For chip only, not including LED current, without I <sup>2</sup> C interface I/O toggle
LED current at touch	$I_{DDLED}$	-	6	-	µA	8 report/sec, LED DAC = 50mA, on yellow skin color (ET=10us)

#### I/O

Input High Voltage	$V_{IH}$	$0.7 * V_{DDIO}$	-	-	V	
Input Low Voltage	$V_{IL}$	-	-	$0.3 * V_{DDIO}$	V	
Output High Voltage	$V_{OH}$	$V_{DDIO} - 0.4$	-	$V_{DDIO} + 0.4$	V	@ $I_{OH} = 2mA$
Output Low Voltage	$V_{OL}$	-0.4	-	0.4	V	@ $I_{OL} = 2mA$

#### LED

Sink current	$I_{LED}$	40	50	60	mA	@ LED DAC = 50mA
LED cathode voltage	$V_{LED-}$	0.4	-	3.6	V	

#### Notes:

- Electrical Characteristics are defined under recommended operating conditions.
- All the parameters are tested under operating conditions:  $V_{DDM} = 3.3V$ ,  $V_{DDIO} = 1.8$  and  $3.3V$ ,  $T_A = 25^\circ C$

## 2.5 AC Characteristics

Table 6. AC Electrical Specifications

Parameters	Symbol	Min.	Typ.	Max.	Unit	Conditions
Power Up from $V_{DD}\uparrow$	$t_{PU}$	-	10	-	ms	From $V_{DD}\uparrow$ to valid interface communication
Address and data delay time	$t_{delay}$	2.75		-	us	Refer to Serial Interface section
Chip Pulse Interrupt Width	$t_{INT}$	2	-	32	us	Default 32us, can be changed in INT_Pulse_Width register
HW POWERDN Time	$t_{powerdn}$	300	500	-	us	POWERDN keep high period

**Notes:**

1. Electrical Characteristics are defined under recommended operating conditions
2. All the parameters are tested under operating conditions:  $T_A = 25^\circ\text{C}$ ,  $V_{DDM} = 3.3\text{V}$ ,  $V_{DDIO} = 3.3\text{V}$  for 3.3V IO application and  $V_{DDIO} = 1.8\text{V}$  for 1.8V IO application.

### 3.0 Mechanical Specifications

#### 3.1 Mechanical Dimension

Figure 3. Package Outline Diagram

### 3.2 Package Marking

Refer to Figure 4. Package marking for the code marking location on the device package.

Figure 4. Package marking

## 4.0 System Design

### 4.1 System Overview

This section describes on how the chip being used to make up a complete system including the explanation on the 3<sup>rd</sup> party components and how they work with the chip.

The PAH8011ES is based on CMOS optical technology and designed to meet the requirements for the implementation in heart rate monitor accessories and wearables like smart watch or wrist band device. Figure 5 illustrates a system design for App Level diagram. The processor is accessing PPG data from the chip, then pass it to App level. APP level applies PixArt provided algorithm library to determine the heart rate data and waveform. Figure 6. System Design for Firmware Level illustrates a system design for Firmware Level diagram. The processor will also access PPG data from the chip, then perform heart rate calculation with PixArt algorithm library and send result to display or end device.

PAH8011ES can be configured to generate different frame rate setting.

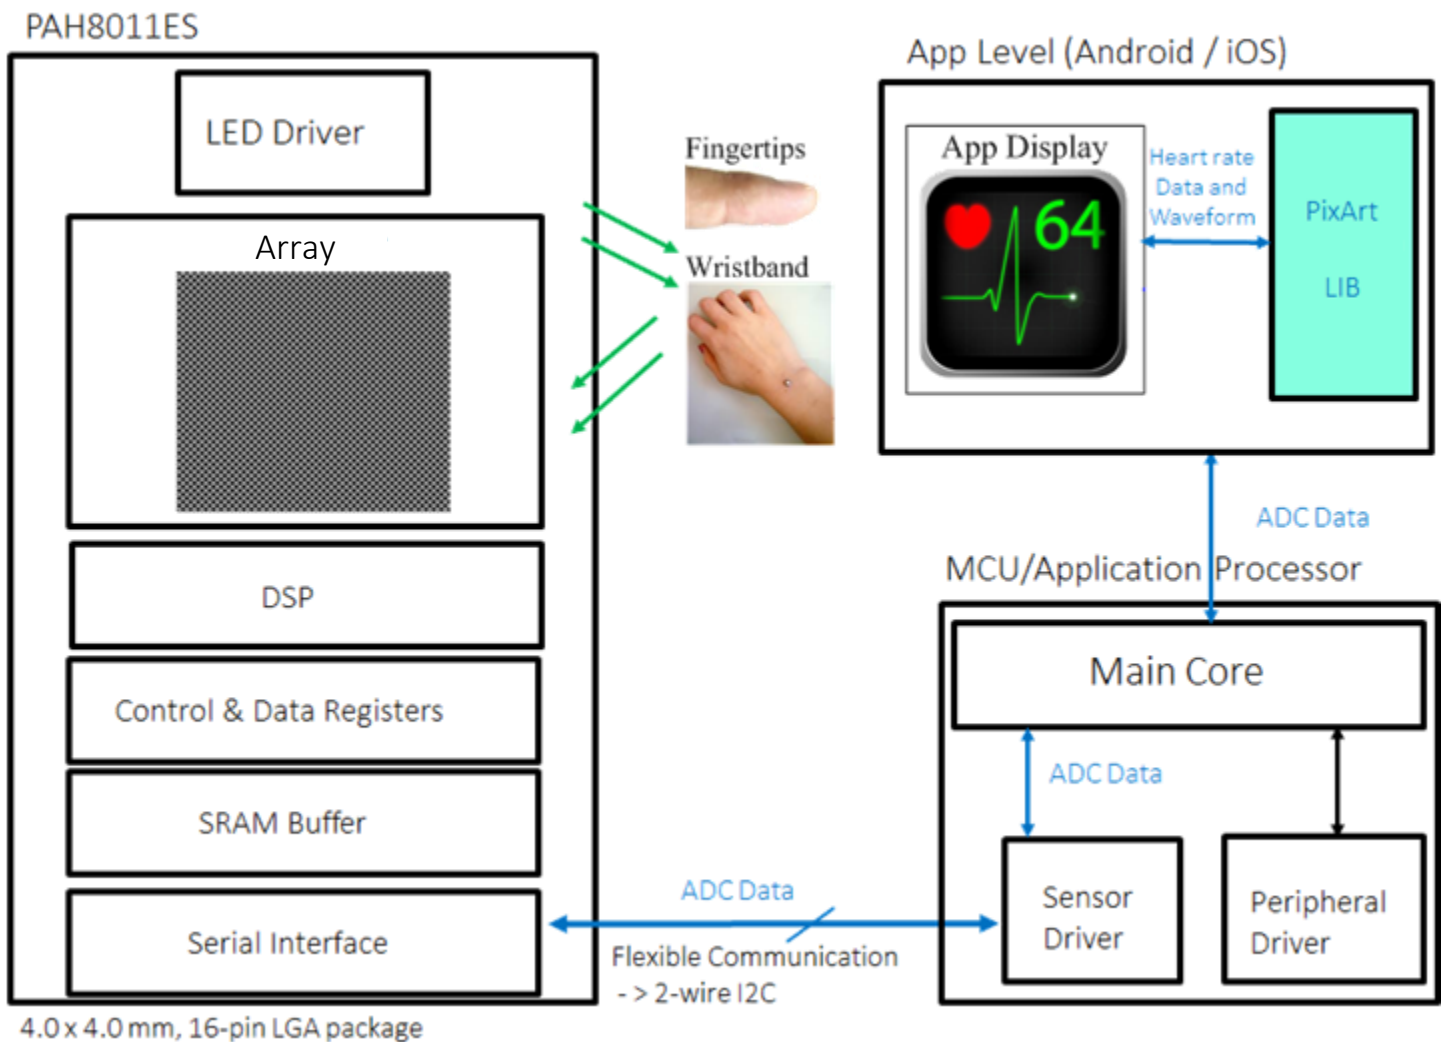

Figure 5. System Design for App Level

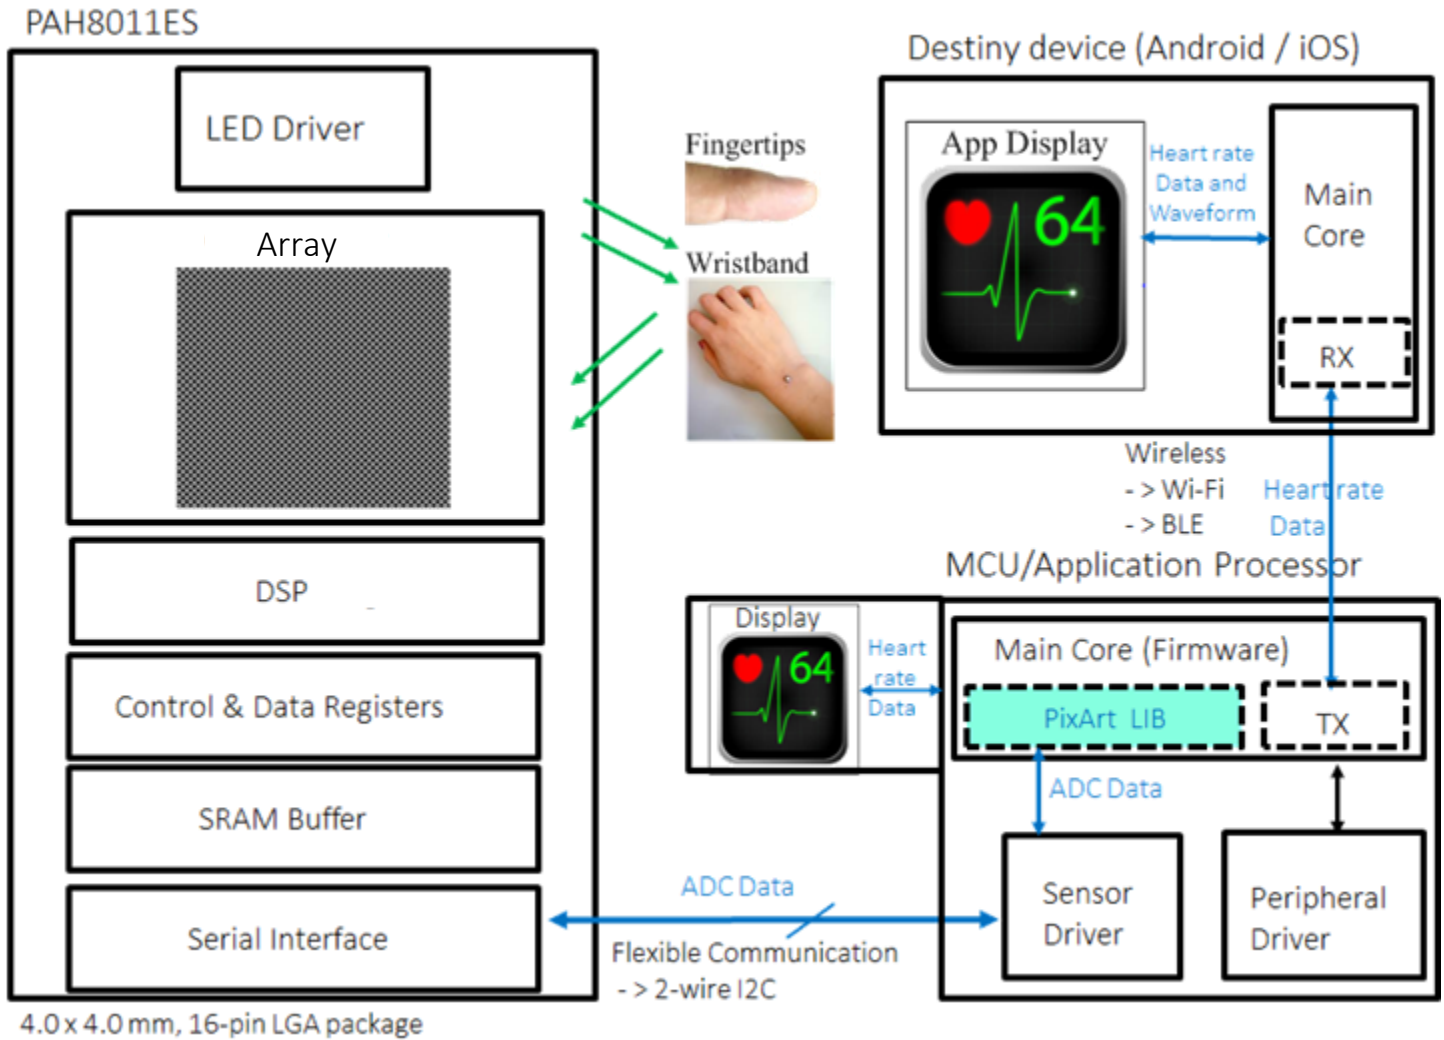

Figure 6. System Design for Firmware Level

## 4.2 Heart Rate Detection

Heart rate detection is an optical measurement technique that uses a light source and a detector to detect cardiovascular pulse wave that propagates through the body. The detected signal (pulse wave) called photoplethysmography and it is known as PPG/PTG. The PPG signal reflects the blood movement in the vessel, which goes from the heart to the fingertips through the blood vessels in a wave-like motion. Therefore, we can use this PPG signal to calculate heart rate.

This optical based technology could offer significant benefits in healthcare application as it is noninvasive, yet accurate and simple to use.

### 4.2.1 Applications

- Heart rate detection in general healthcare (Perfusion Index : Typ.1% )
- PPG Waveform

**4.2.2 Heart Rate Detection Performance**

Table 7. Heart Rate Detection Specifications

Parameters	Value	Unit	Conditions
Heart Rate Measurement Range	30 – 240	bpm	
Heart Rate Tolerance of Average Root Mean Square (ARMS)	±3	bpm	@ Room temperature for steady state: 0 km/hr.
	±5	bpm	@ Room temperature for motion state: 0 – 9 km/hr on the treadmill.
Response Time	8 – 10	second	@ Heart Rate = 72/bpm

**Notes:**

- PAH8011ES can provide heart rate measurement. However, it is not for medical device usage.
- For usage of heart rate detection chip on the wearable device that to be put on the wrist, finger or palm,
  - The chip must be placed securely and in-contact with the skin surface as well as keeping it stable without any motion during measurement in acquiring accurate heart rate measurement.
  - Do not wear the device on the wrist bone. It should be wear on the higher position of, especially for those with a smaller wrist.
- Chip's performance is optimized with good blood flow. It is recommended to have light exercise for a few minutes to increase your blood flow before turning on the heart rate monitor.
- On cold weather condition or user is having poor blood circulation (e.g.: cold hands, fingers and feet), the chip performance (heart rate accuracy) could be effected as the blood flow is slower in the measuring spot position. It is recommended to activate the heart rate monitor in indoor use.
- If the chip is having problem to read heart rate, may try to swap it on the other side of hand wrist to repeat the measurement.
- For continuous heart rate measurement, do minimize hand movement and extreme bending of the wrist.

4.3 Reference Schematic

Figure 7. Reference Application Circuit

#### 4.4 Design Guidelines

##### 4.4.1 Schematic Design

1. VDDM & VDDIO & VDDLED: 3.3V, VDD18V: 1.8V (for 3.3V System)
2. VDDM & VDDLED: 3.3V~3.6V, VDDIO: 1.8V, VDD18V: 1.8V (for 1.8V System)
3. VDDM & VDDLED: 3.3V~3.6V, VDD18V: 1.8V, VDDIO: 2.8V (for 2.8V System)
4. It is recommended to separate the power system of VDDM/VDDLED and wireless system to avoid power interference.
5. The maximum load current of LDO (supplying power to VDDM/VDD18V/VDDLED/VDDIO) need to be larger than 250mA. For maximum current of each power rail, refer to IDDM\_MAX, IDDLED\_MAX, IDDD\_MAX, IDDA\_MAX, IDDIO\_MAX and IDDAY\_MAX parameters in Table 5. DC Electrical Specifications
6. I2C\_SDA and I2C\_SCL must pull high to VDDIO with resistor.
7. VDDM, VDDD, VDDA, VDDAY must have 0.1μF capacitor connecting to GND and place closely to 8011.
8. The AGND, DGND and LEDGND must be separated and connected to PCB main GND.
9. INT1 pin is recommended to be connected to MCU HW INT as data ready INT for power saving.
10. INT2 pin is recommended to be connected to MCU HW INT for touch function.
11. Ensure that the VDDM, VDDLED, VDD18V's power noise should be under 100mV. (with 0.1μF and 10μF capacitor)
12. At power on, VDDIO must be powered on equal to or first than VDD18V.  
Note: When VDDIO must be powered on first before VDDM, host should prevent using the I2C interface (connected with chip) to switch the LDO providing VDDM voltage.
13. At power off for 1.8V IO system, VDDM must be powered off first than VDD18V/VDDIO.
14. At power off for 2.8V/3.3V IO system, VDDIO and VDDM must be powered off first than VDD18V.
15. When PAH8011ES is not in used, put the chip into Power Down Mode.

##### 4.4.2 Recommend Layout PCB

###### 4.4.2.1 Pad Dimension on PCB/FPC

1. Pad size design:
  - If use solder mask defined (SMD), pad size is referred as solder mask opening size.
  - If use non-solder mask defined (non-SMD), pad size is referred as copper metal size.
2. Recommended dimension of pad is shown in Figure 8. The actual pad size design will need to consider components aside. (All dimensions are in mm)

Figure 8. Recommend Layout PCB

4.4.2.2 Recommendation of Stiffener

If use FPC (Flex) board, need add stiffener for FPC (Flex) back-side (at Sensor package area) to enhance the flex strength.

1. Recommended stiffener type: FR4 or stainless steel.
2. Recommended stiffener thickness: minimum 0.4mm for FR4 type, minimum 0.15mm for stainless steel.

4.4.2.3 Recommended use 0.1~0.12mm thickness stencil for SMT process.

1. The stencil thickness selection will need to consider passive component size aside package.
2. In case of the package is surface mounted on FPCB (Flexible Printed Circuit Boards), the overall thickness of cover layer & adhesive layer is recommended to be controlled less than 40um.

4.4.2.4 PCB Layout Guidelines

The following guidelines can be refer to Figure 9. PCB Layout Guide.

1. Trace width of VDDM, VDDIO, VDDLED, VDDA, VDDD, VDDAY, LED0, LED1, LED2 traces must be at least 8 mils.
2. Capacitor 0.1μF must be placed close to the chip package.
3. The GND plane of GND of VSSA, VSSD and VSSLED must be layout separately and connected to the PCB's main GND.
4. If use FPC (Flex) board, recommend VSSLED pin separately to output pin, because of high LED current operation.

Figure 9. PCB Layout Guide

#### 4.5 Recommended Guidelines for PCB Assembly

Recommended vendor and type for Pb-free solder paste

1. Almit LFM-48W TM-HP
2. Senju M705-GRN360-K

IR Reflow Soldering Profile can be refer to Figure 10. IR Reflow Soldering Profile: Temperature profile is the most important control in reflow soldering. It must be fine-tuned to establish a robust process.

Figure 10. IR Reflow Soldering Profile

**Note:**

## Document Revision History

Revision Number	Date	Description
1.0	09 May 2017	Product release version. Update from previous version v0.91 1. Add maximum load current of LDO in Section 4.4.1 Schematic Design 2. Update Figure 4. Package marking
1.1	20 Oct. 2017	1. Remove PCB Layout Guidelines item(5) 2. Modify Debug Mode as Info. Mode Modify Recommended Layout PCB
